

Creating a positive social impact for men's health

Movember was initially a whimsical marketing campaign which encouraged men to grow moustaches to raise awareness for prostate cancer during the month of November. The campaign spread like wildfire and the charity is now responsible for raising \$55.5 million (USD) annually through their mobile and web platforms.

Challenges

Early drop-offs

Fundraisers were churning alarmingly fast within the first few days of the campaign with a slight spike in activity towards the end.

Turning complex into simple

Movember's app became severely bloated with dozens of overwhelming features; it contained over 150 pages.

Goals

What does success look like?

- Improve retention and campaign promotion
- Improve average fundraiser donations

My involvement

I led a small design team to conduct research, validate/build prototypes and create final assets. I worked alongside product owners and engineers.

Product journey & use cases	Offline conversation with friends happen first. Already has an account. Starts using the app by updating profile picture, goal and reviewing how much was raised the previous year. Might open the app every week or so to check fund progress as it's easier than the web experience	Does it every year with his dad and family. Starts by donating to approx \$20 himself. Sets up targets and goals, then shares on facebook. Opens the app to check progress and keep track of donations. Him and his family use whatsapp to share banter and progress shots every few days	Doesn't have a team. Uses the web experience to set targets and share on facebook. Directly messages or talks to people to thank them/promote. Most communication done through facebook / texting on campaign. Doesn't see the point of installing the app if only used for a month.	Hasn't done it since 21 old work mates in a te profile photo in which edit. Sets a move and Updates the profile ph as the month goes on week with donation up	
Involved in the cause	Isn't personally affected by men's health issues. Does the campaign for fun with friends at work. No emotional driver	Has been personally affected by men's health issues but prefers not to disclose details publicly. His close family and friends know about it	His dad has been affected, doesn't list this in the share post. Friends and family are aware. Sometimes forgets about the campaign as "it's not as popular anymore"	Having fun with friend cause	
Donations	Most donations come in the first few days or at the end of the campaign. Checks email notification when email comes in and will text the person directly to thank them.	His dad is responsible for generating the donations by promoting on facebook. They have a family team set up. He texts his friends directly with goofy pictures to ask for donations	Shares the campaign once in the first week. Check and shares progress at the end with thank you message. Doesn't engage with product outside of that	Will usually compete v net the highest donati on social media chanr	
Content	Really likes being able to see progress up front but thinks "there's a lot going on". "It's like another social network to manage"	Likes the informative and detailed information on his profile page, "it's hard to see it all at once". Only uses team and profile page

Understanding the user drop-off

Customer interviews

I worked with Movember's researchers to interview fundraisers and understand the challenges faced during their experience.

Journey mapping

Leveraging the customer interview data, I worked with product owners to visualize and piece together the Movember journey.

Key insights

Fundraisers didn't see the point of consistently sharing throughout the month.

Feature discovery was hindered - fundraisers only used 2/25 app features.

73% of fundraisers preferred to be discreet about why they started a Movember page.

Design principles

- Encourage feature discovery by simplifying.
- ~~Social network~~ Content creation app.
- Improve fundraisers' sharing frequency.

Slide on MVP shaping with PO

Customer interviews

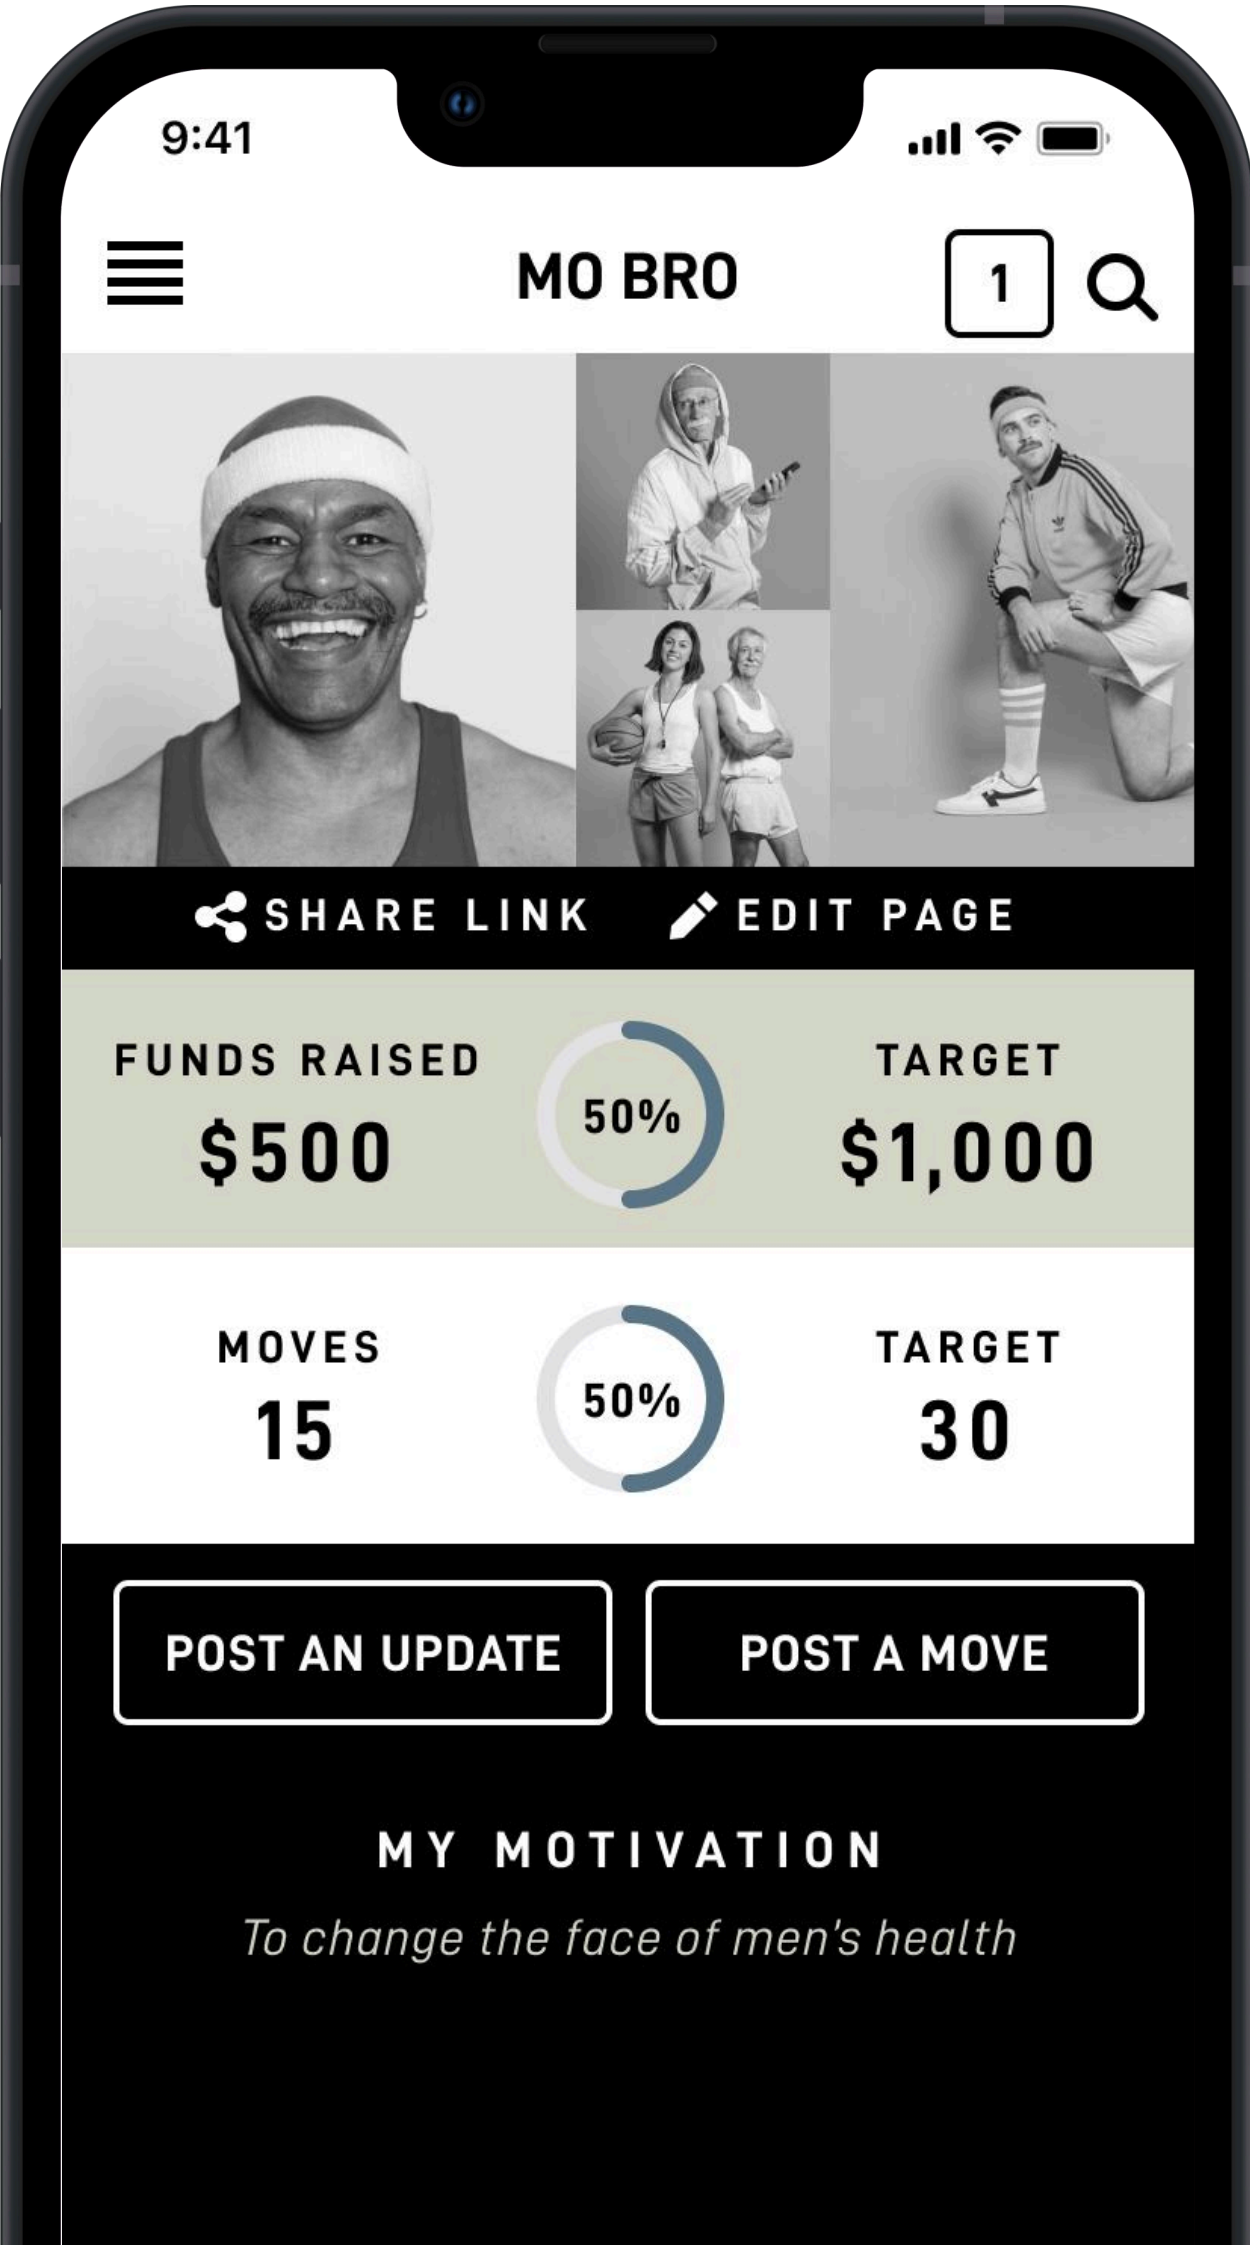

I worked with Movember's researchers to interview fundraisers and understand the challenges faced during their experience.

Journey mapping

Leveraging the customer interview data, I worked with product owners to visualize and piece together the Movember journey.

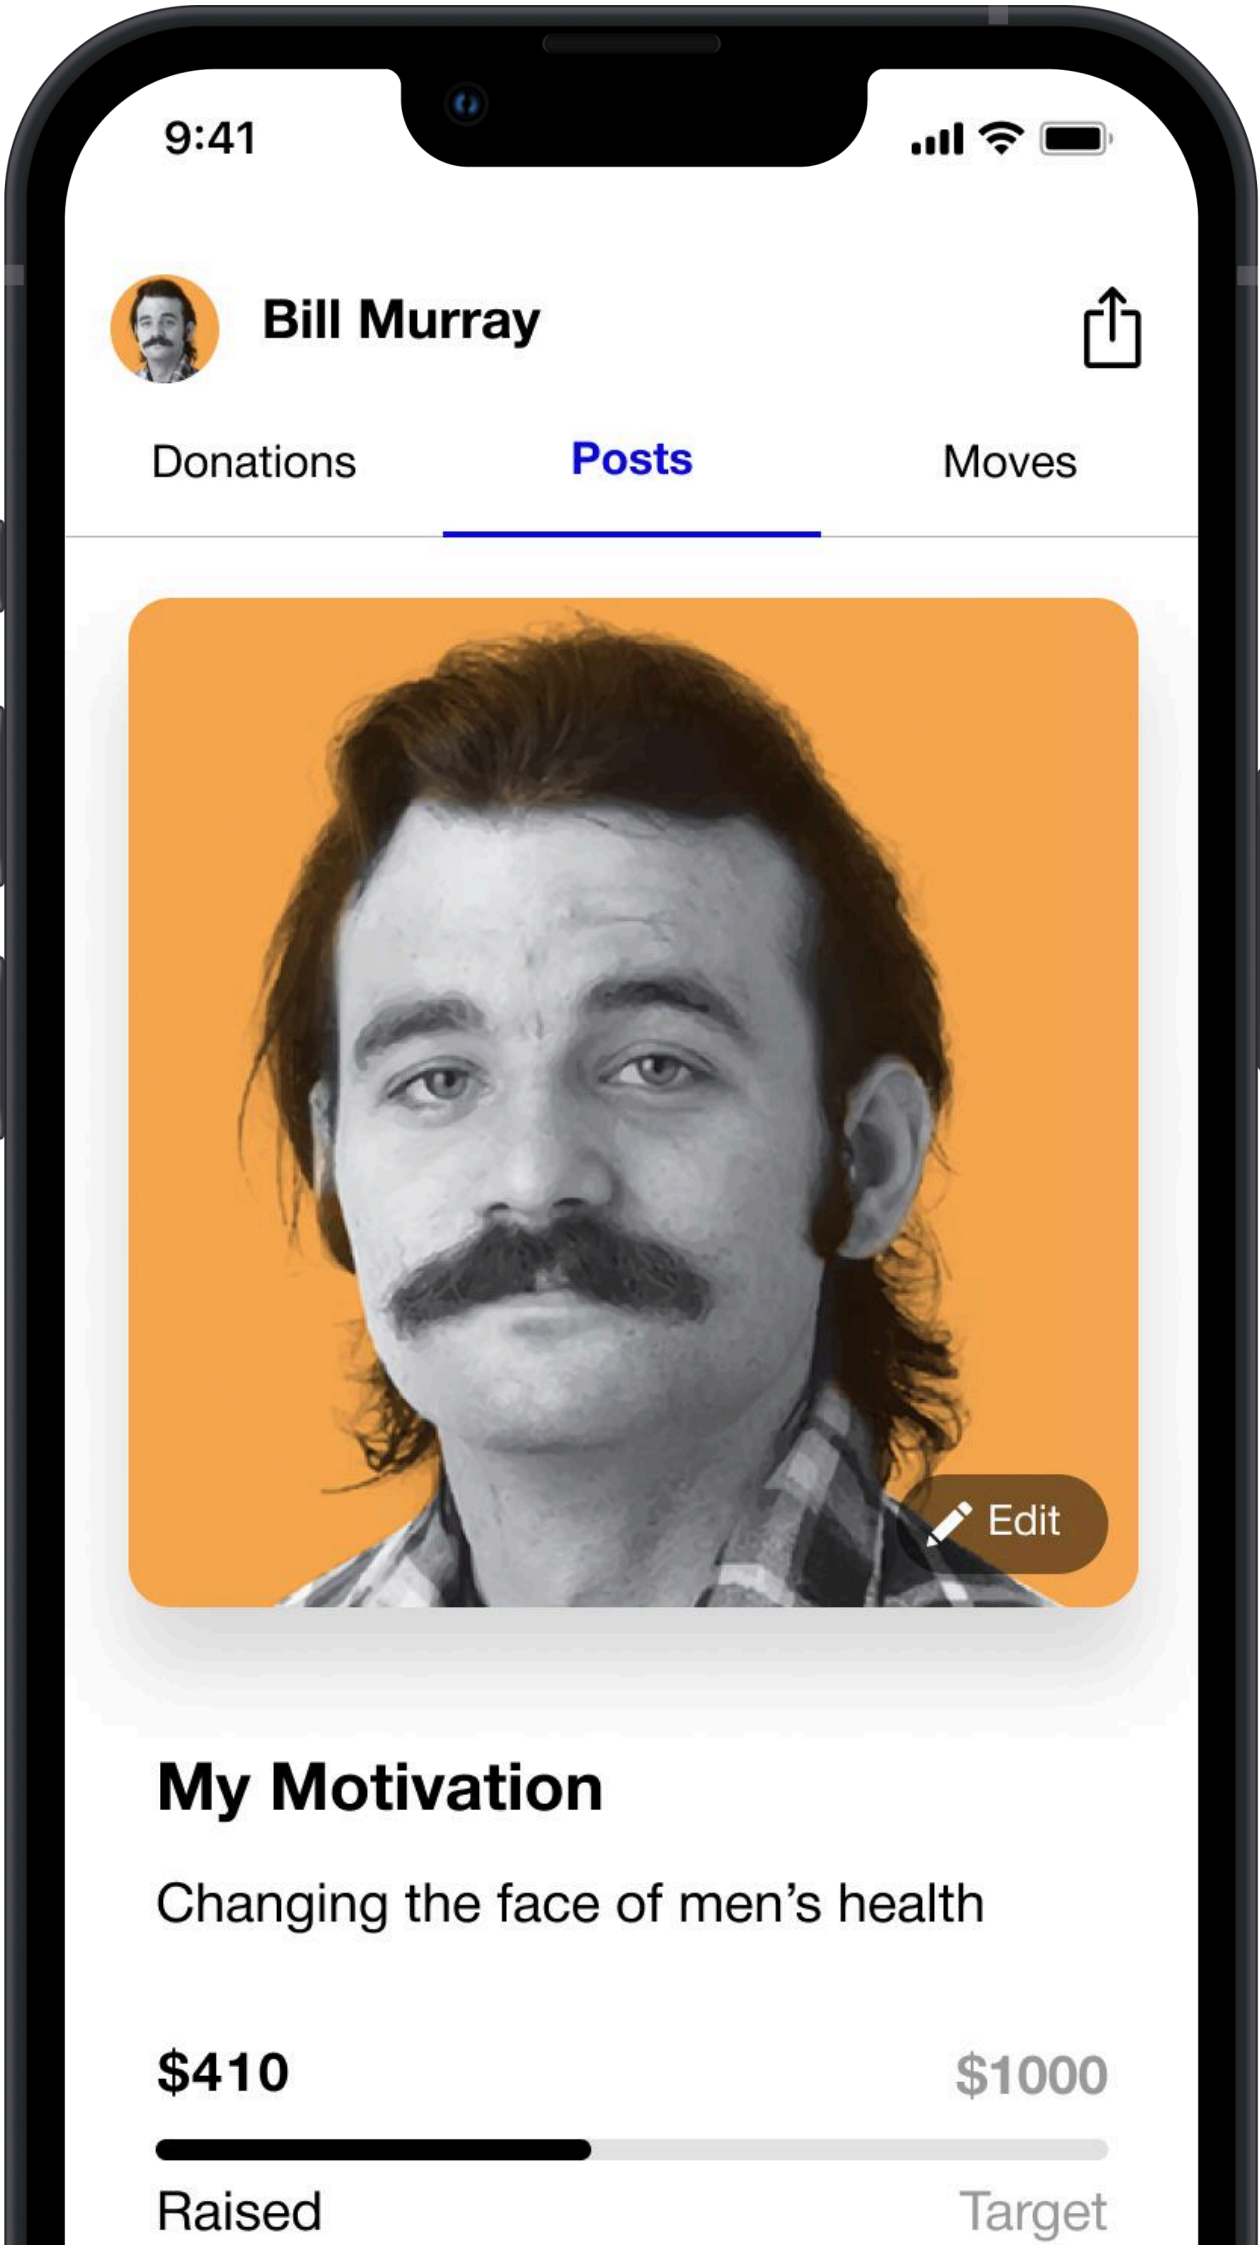

Existing experience

After digging deeper into the old experience, I noticed UX red flags, such as poor grouping (law of proximity), tiny hit targets and the combination of multiple navigation paradigms (tab bar & hamburger menu).

First iteration

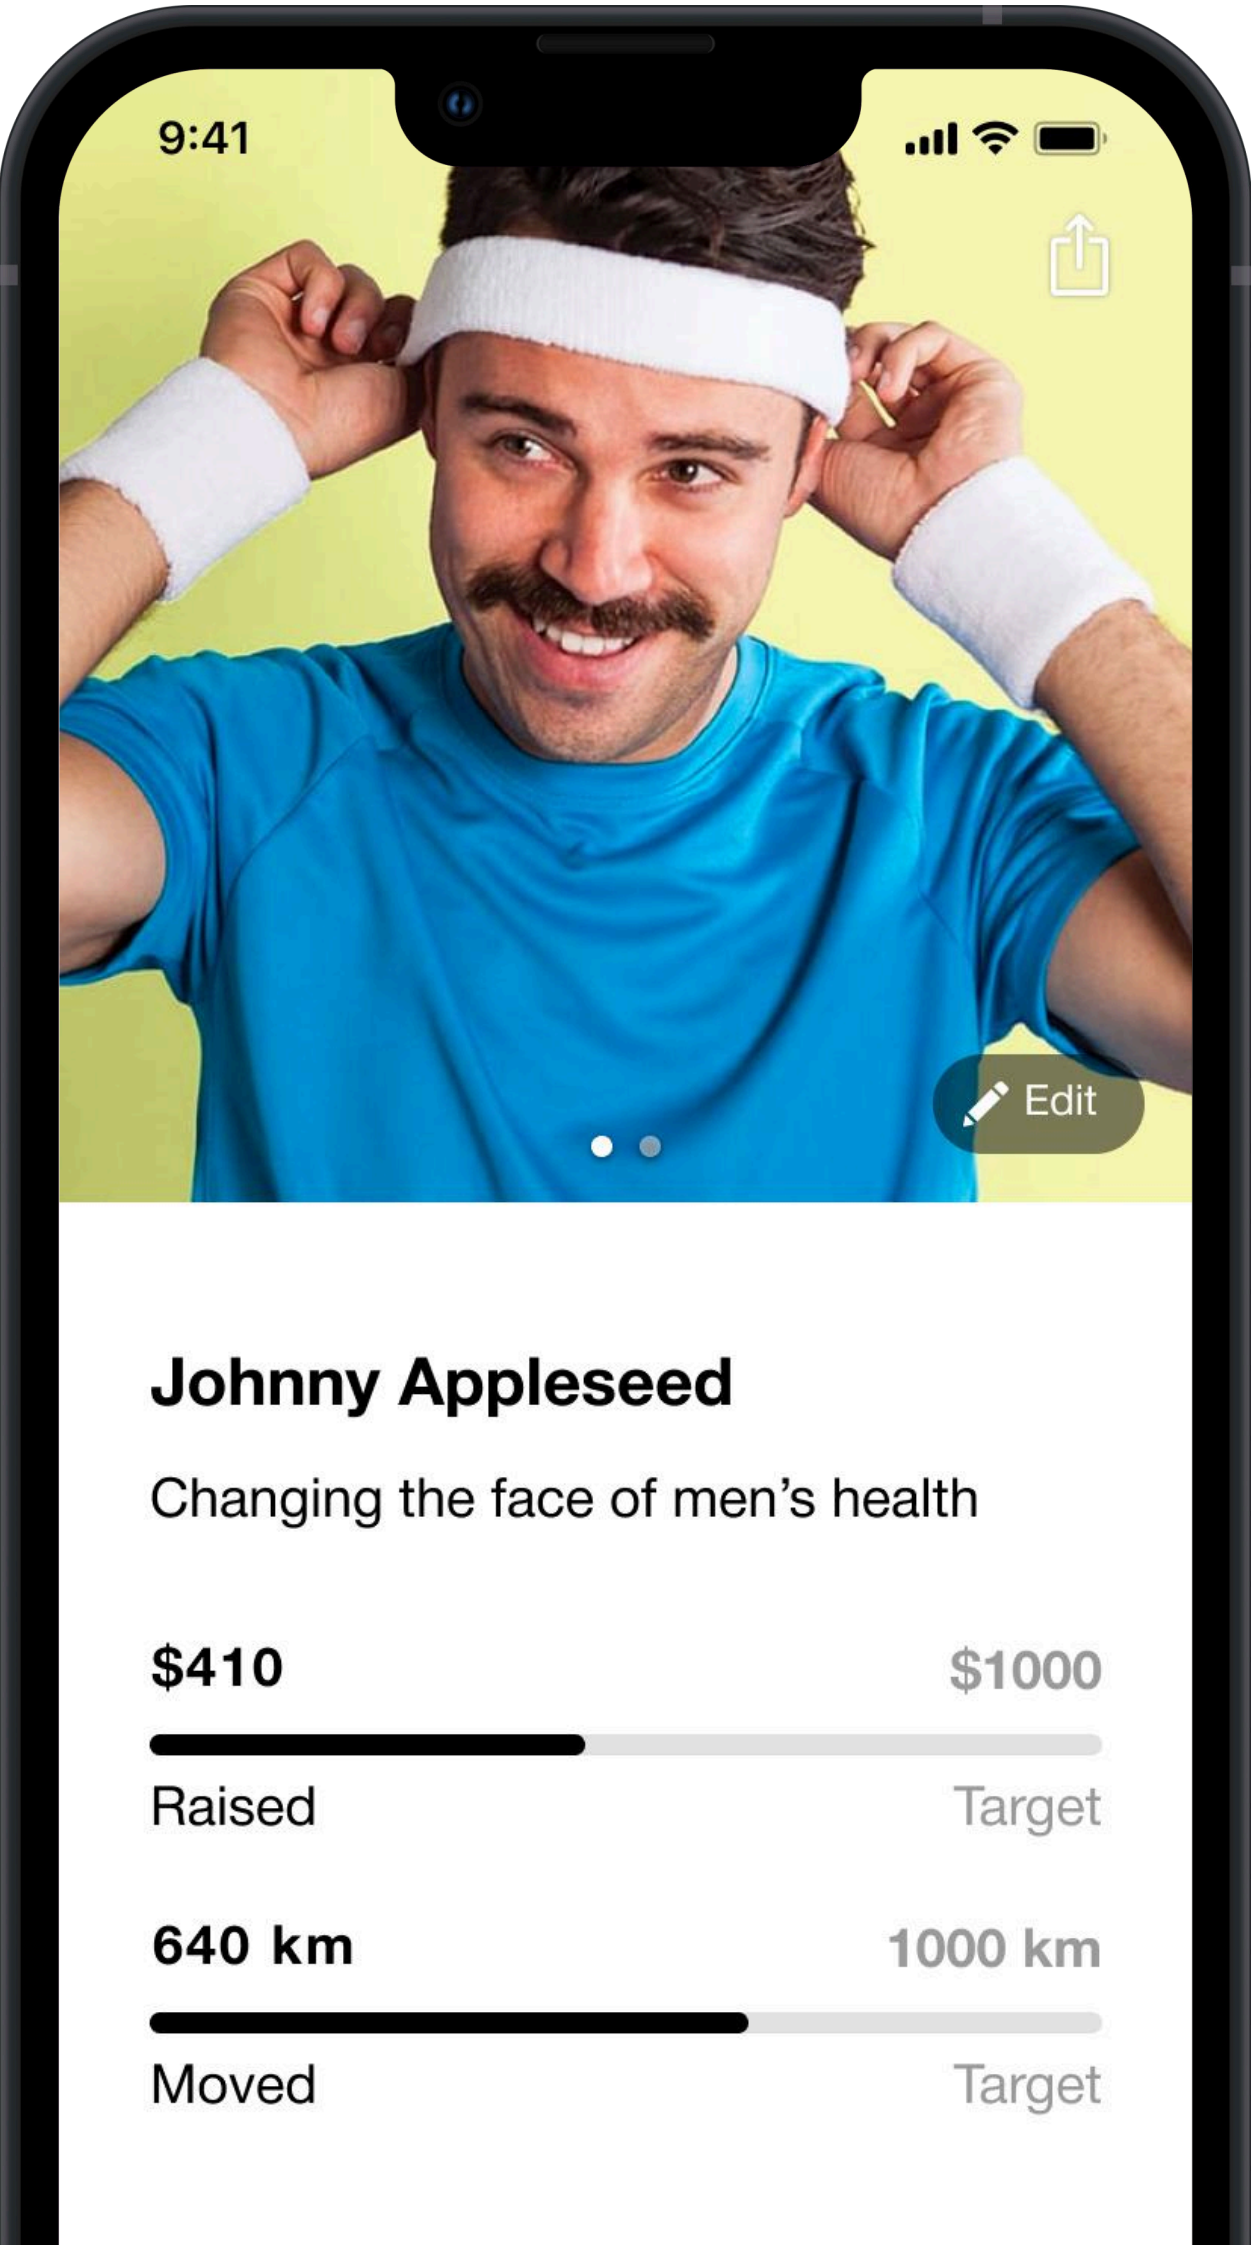

This version explored simplifying by segmenting page content with tabbed navigation. The simple experience is designed to provide critical fundraising tools and progress at a glance.

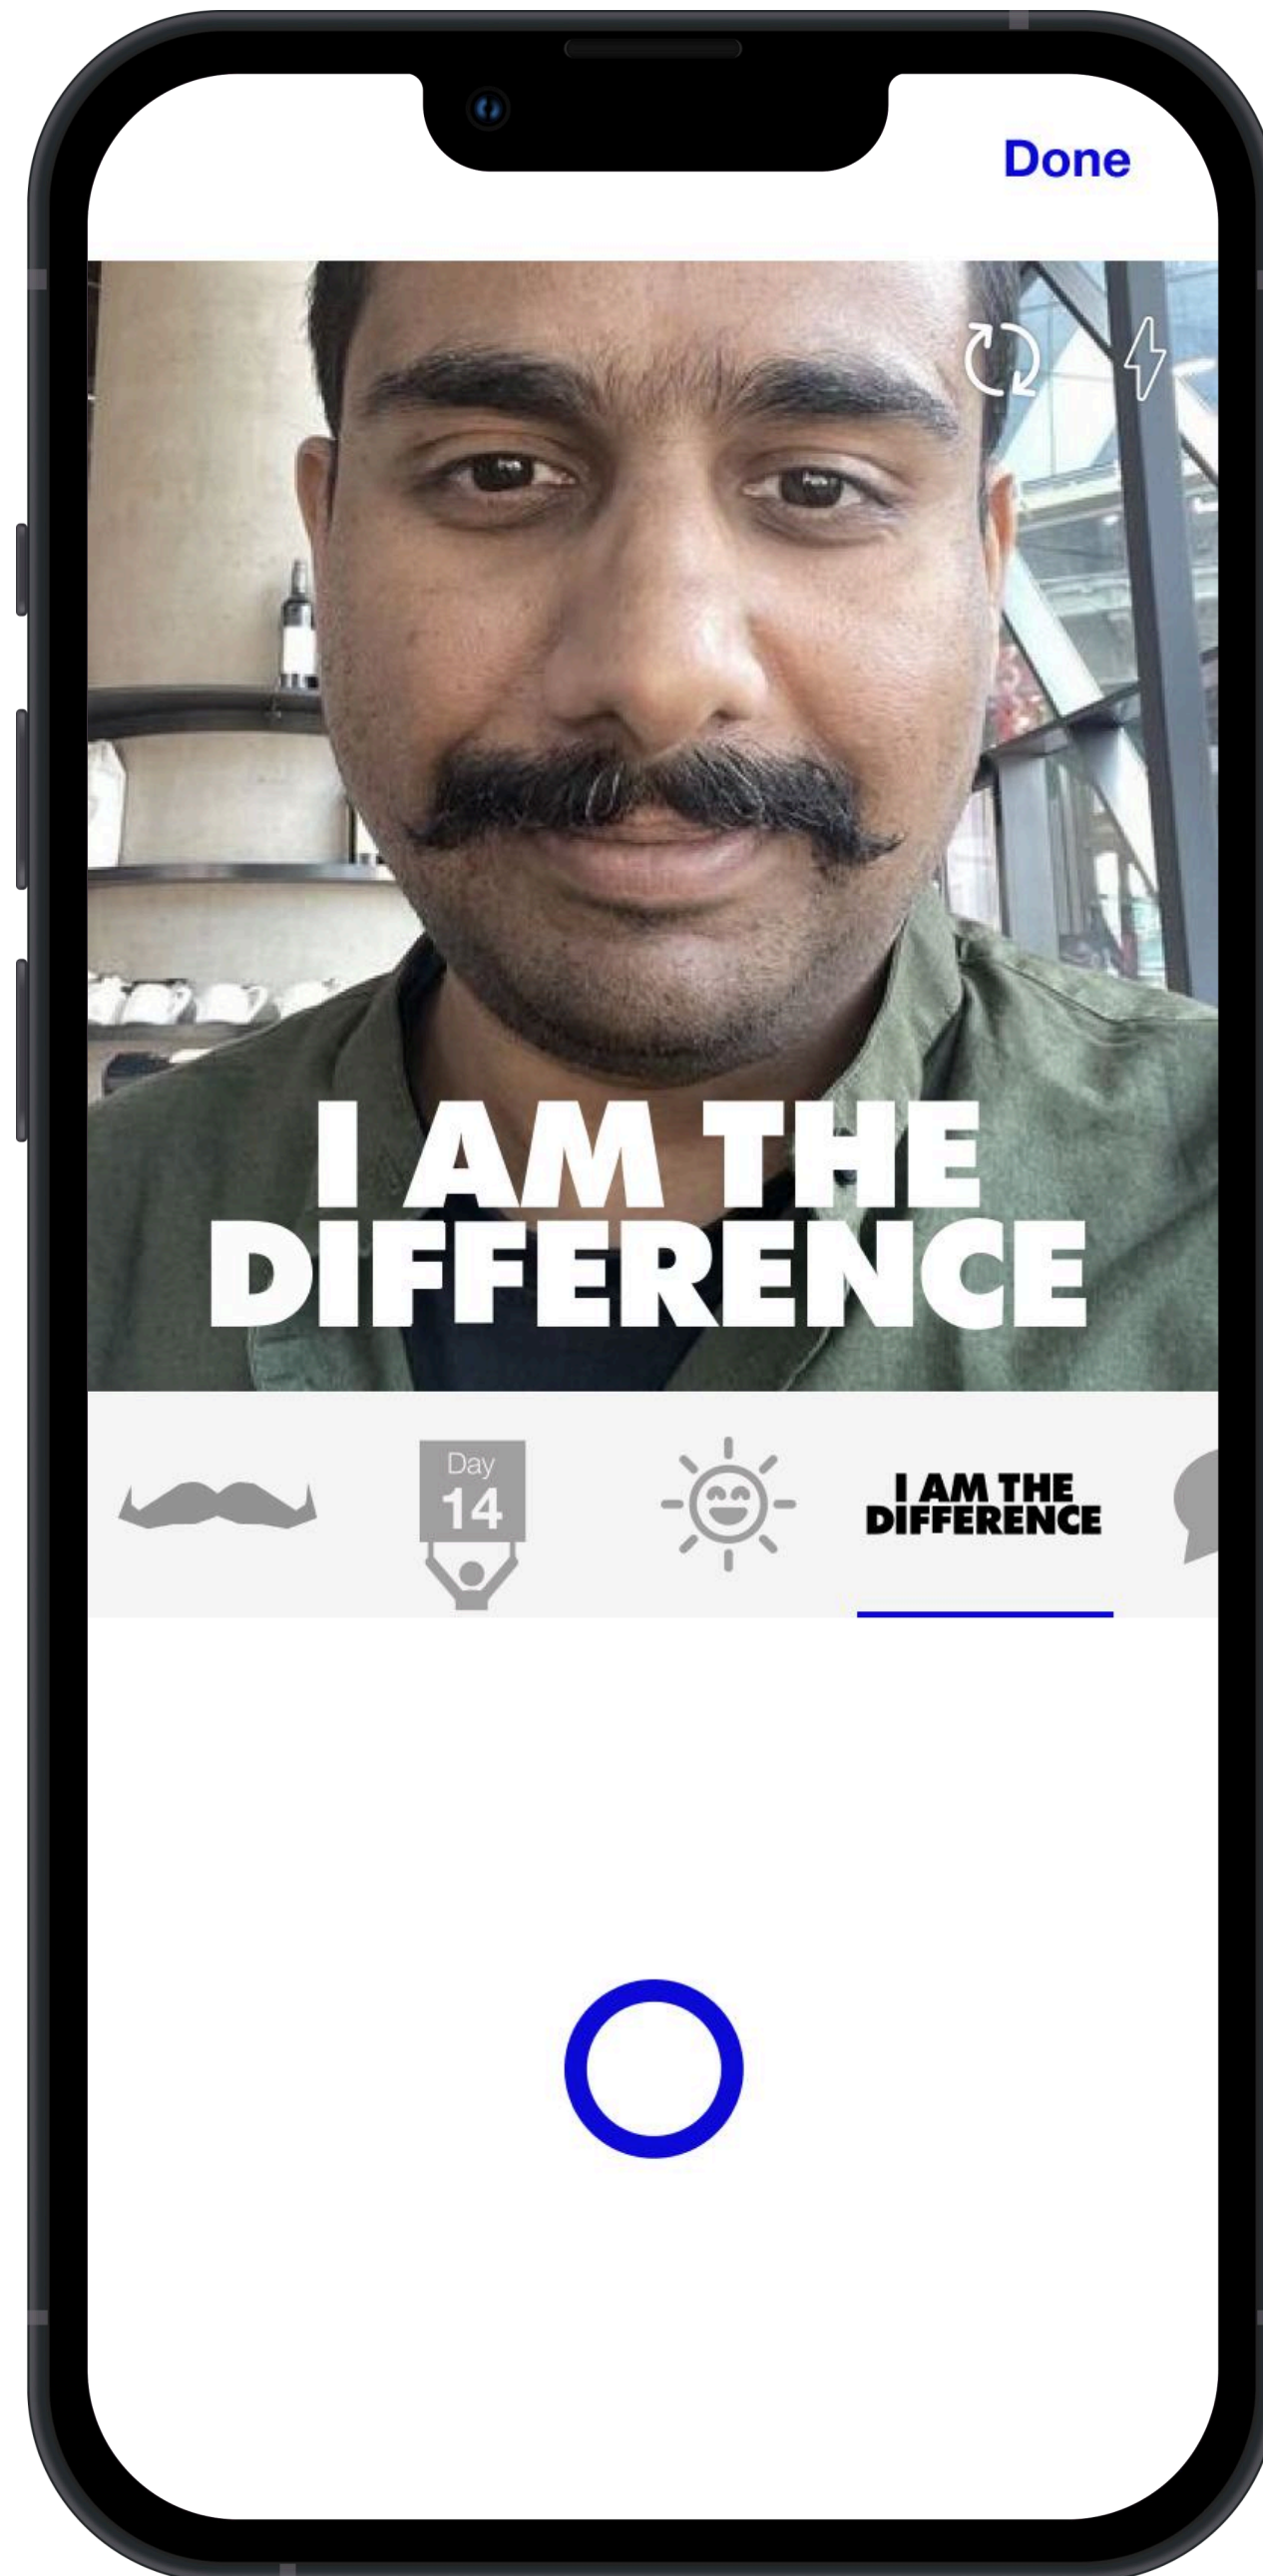

Second iteration

Shipped

After testing the 1st iteration, we simplified the designs by merging the dashboard's content into a single page experience. Improving fundraising progress visibility made it easier for fundraisers to visualize targets.

CAMERA FEATURE

Shipped

Capitalizing on Movember's selfie culture

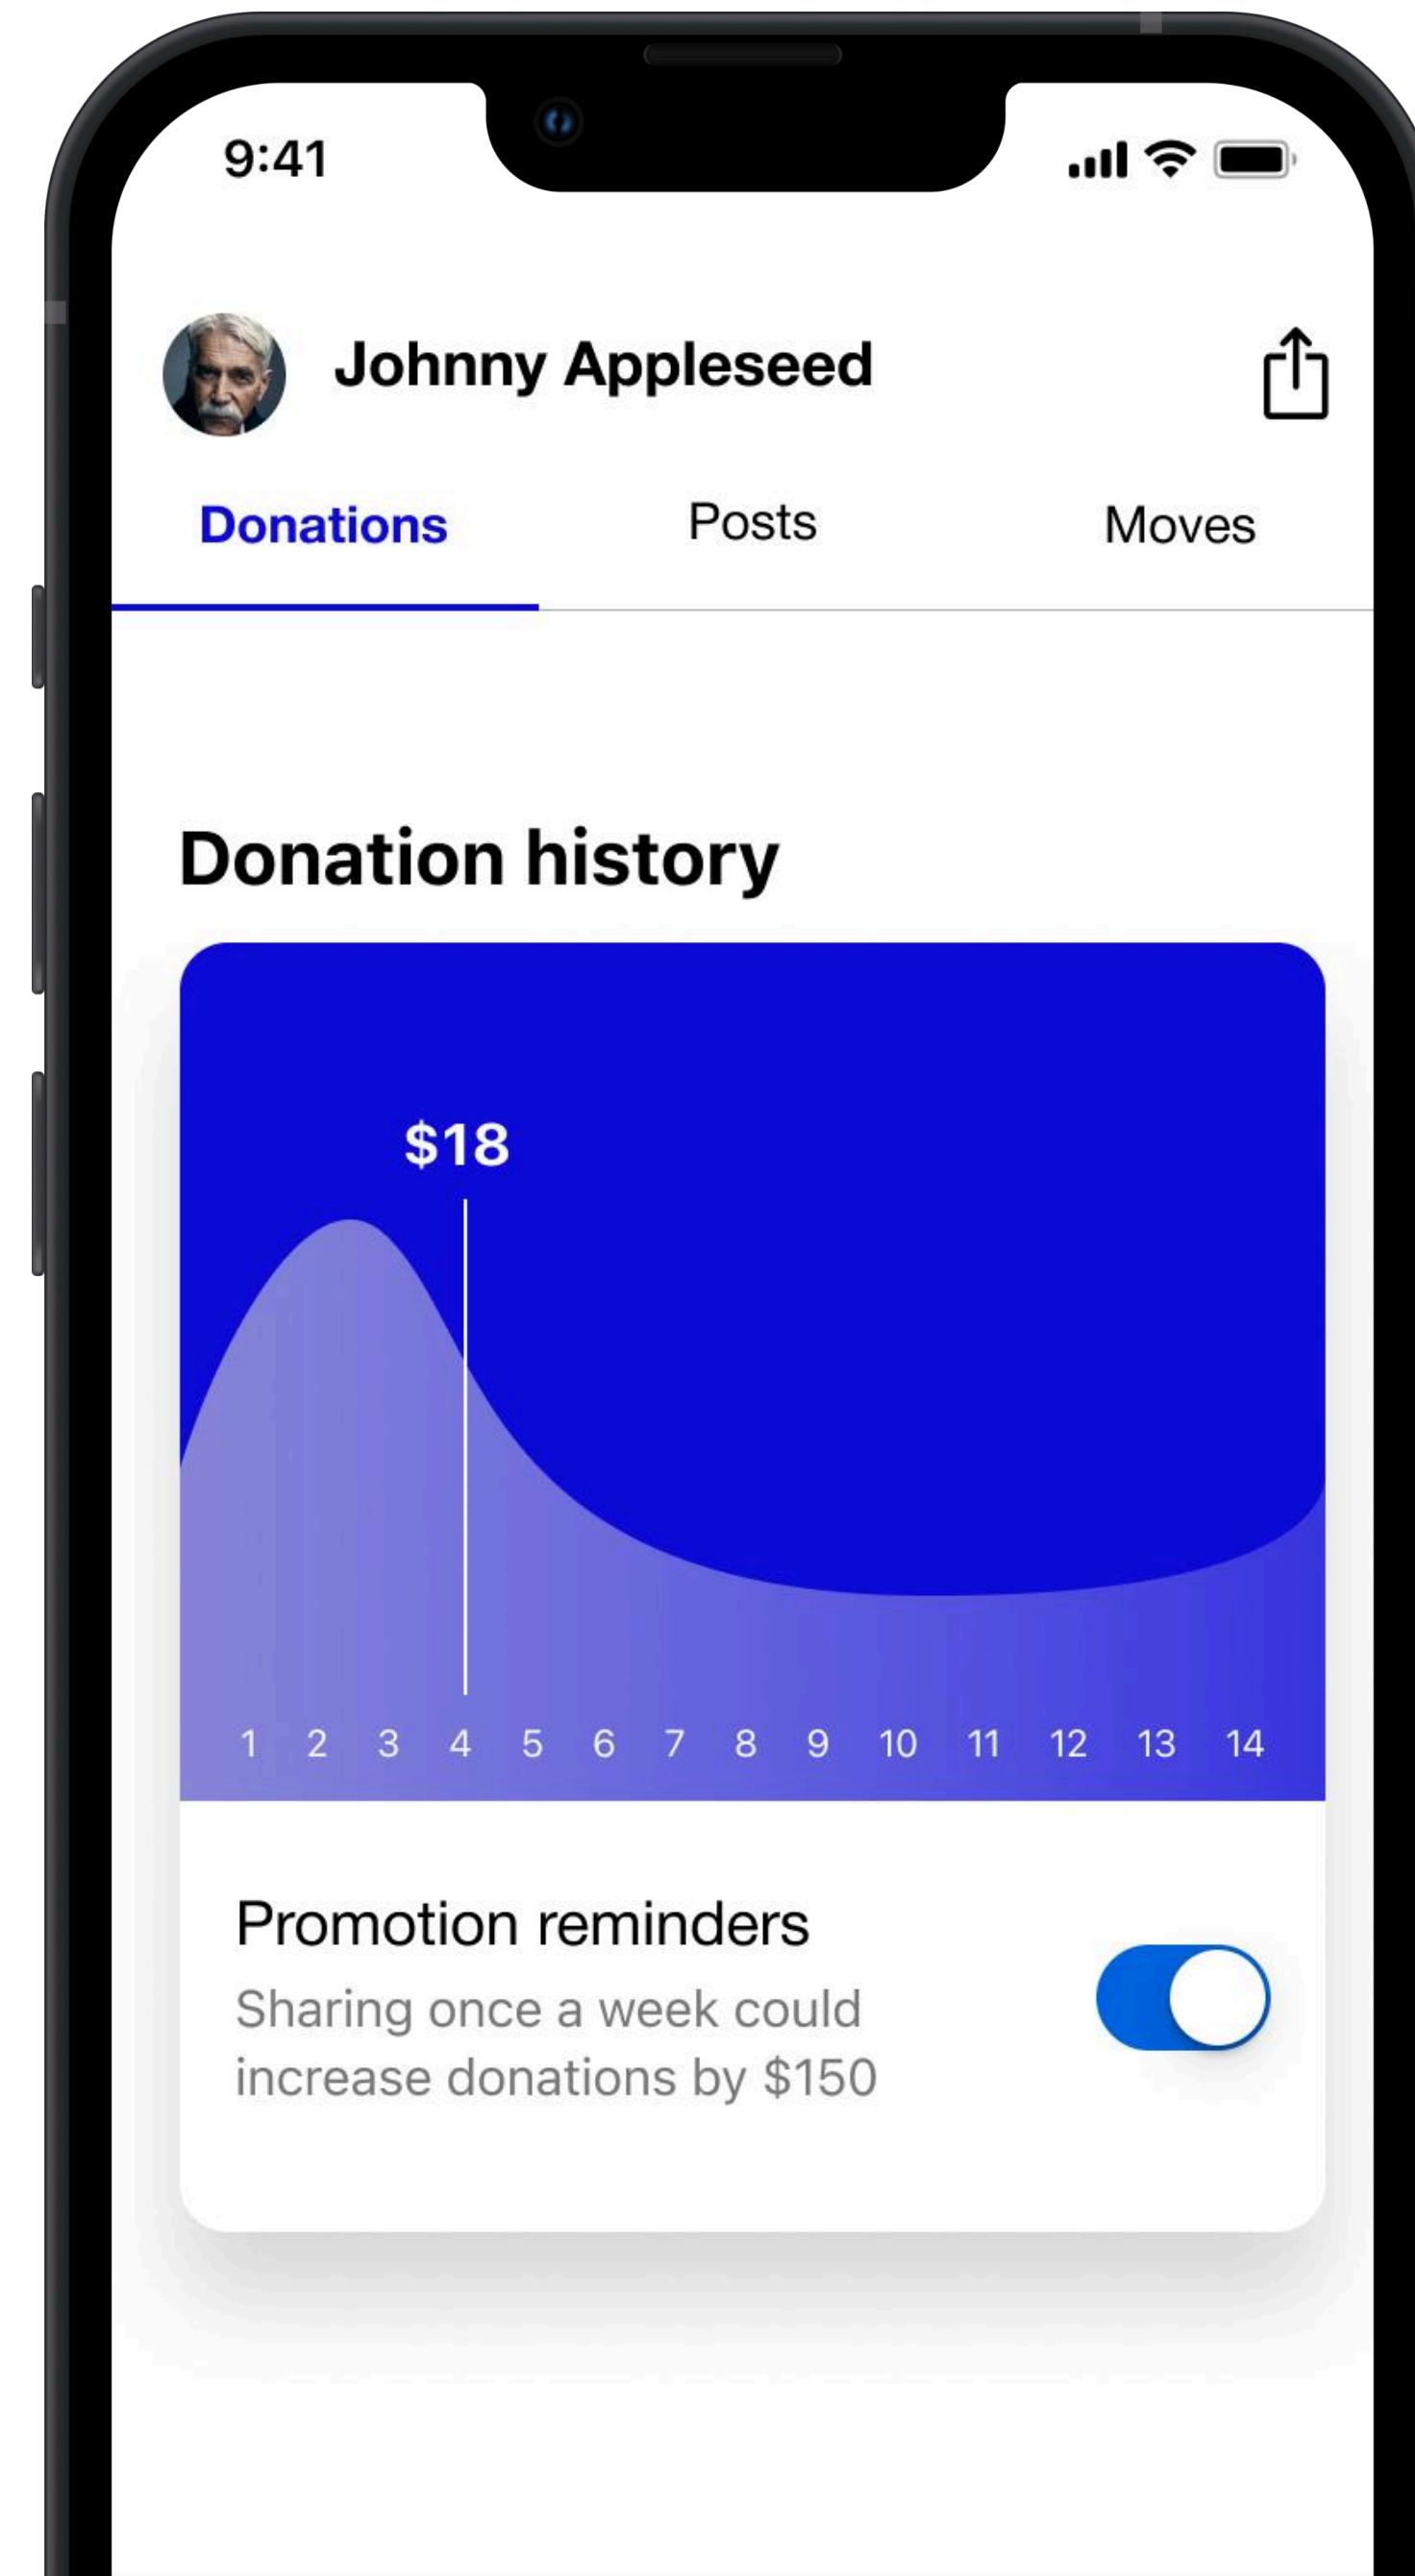

Instead of trying to compete with the engagement happening within fundraisers' closed-off communities, we embraced it and conceptualized the mo-cam—a light-hearted, shareable content creation tool. Working closely with the marketing team, I used Hofstede's cultural comparison tool to tailor filters for multiple countries, ensuring our contextual slogans encouraged sharing by being culturally relevant.

ADDITIONAL CONCEPTS

Didn't Ship

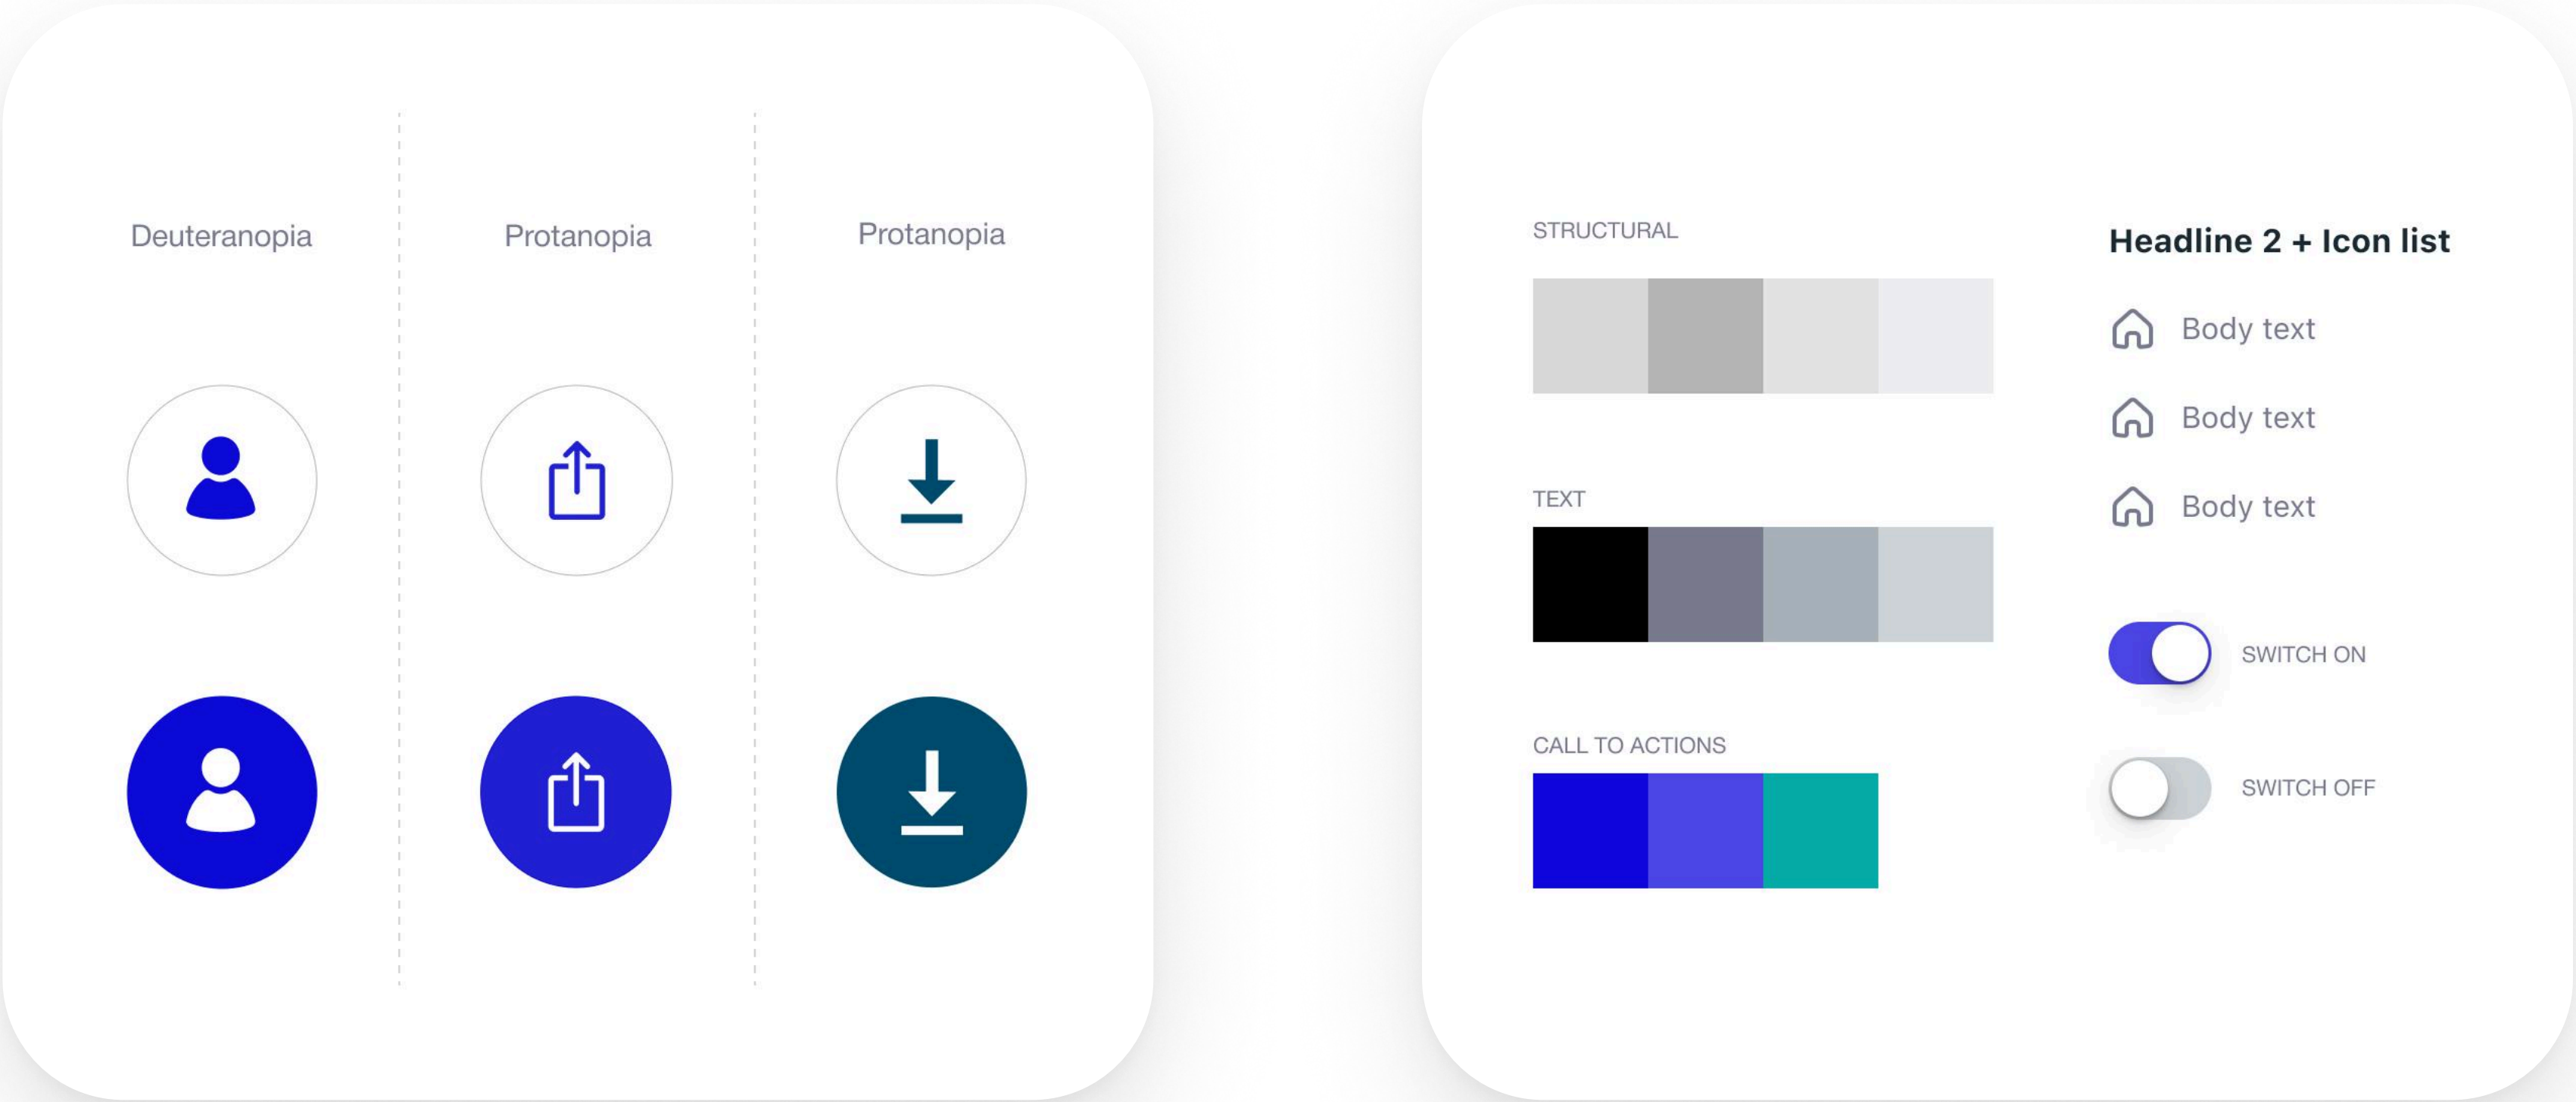

Encouraging strategic sharing

Surprisingly, user testing had shown that fundraisers didn't see the value in improving their sharing frequency. Leveraging the psychological principle of "loss aversion", I conceptualized ways to communicate how the lack of sharing affects users' campaign bottom line.

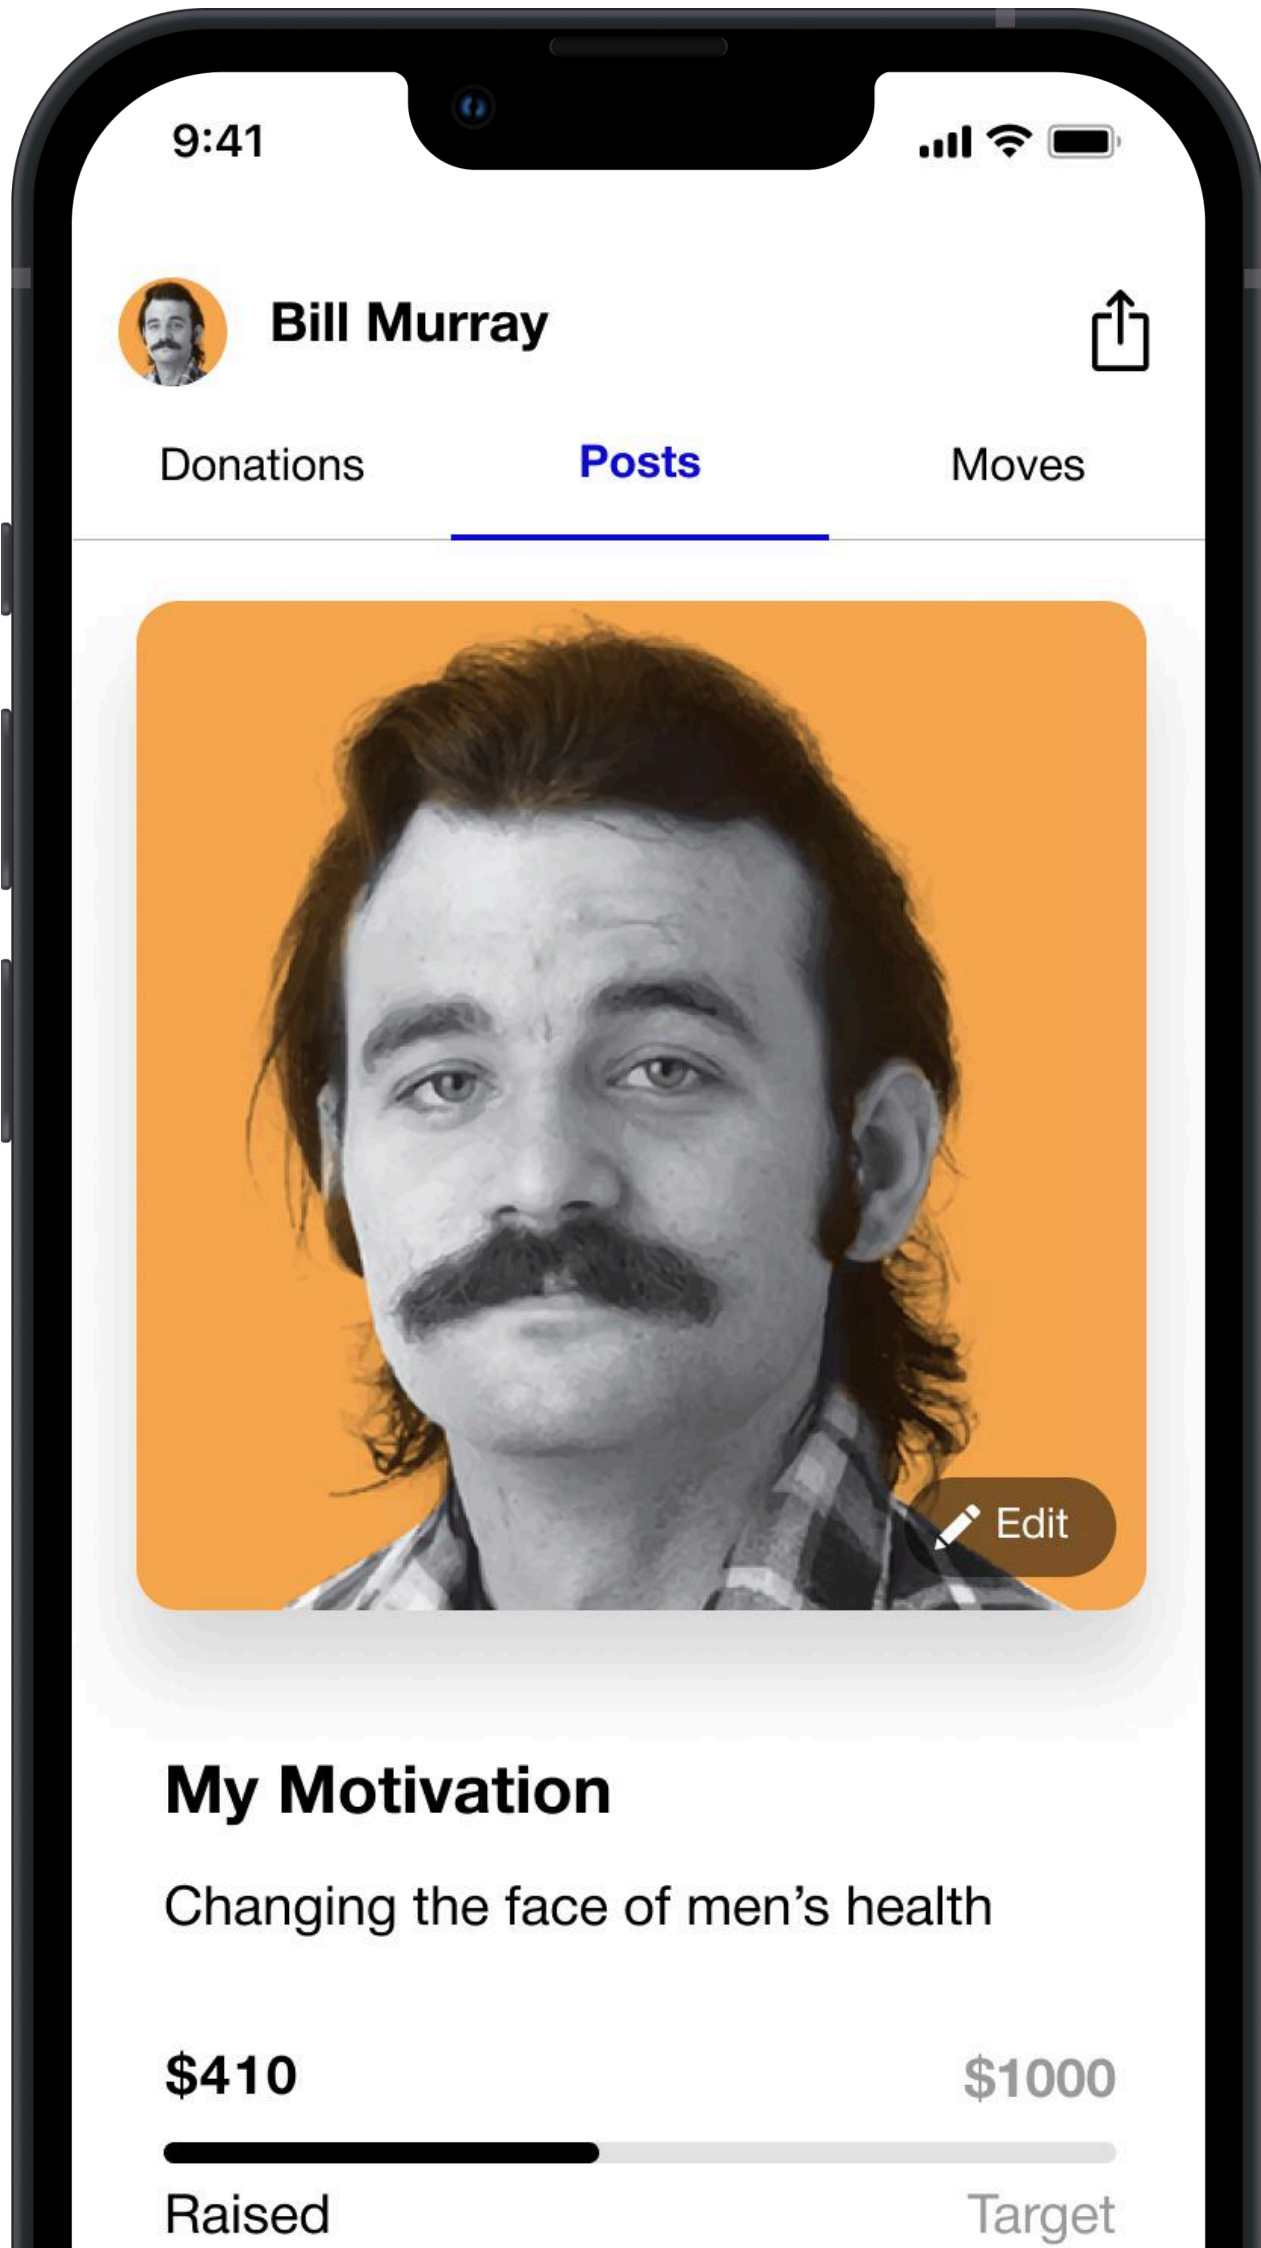

Creating the design system

Upon finalizing the app's core experience, I created a lightweight design system for designers and developers alike, ensuring consistency, design pattern re-usability, accessibility, and faster development.

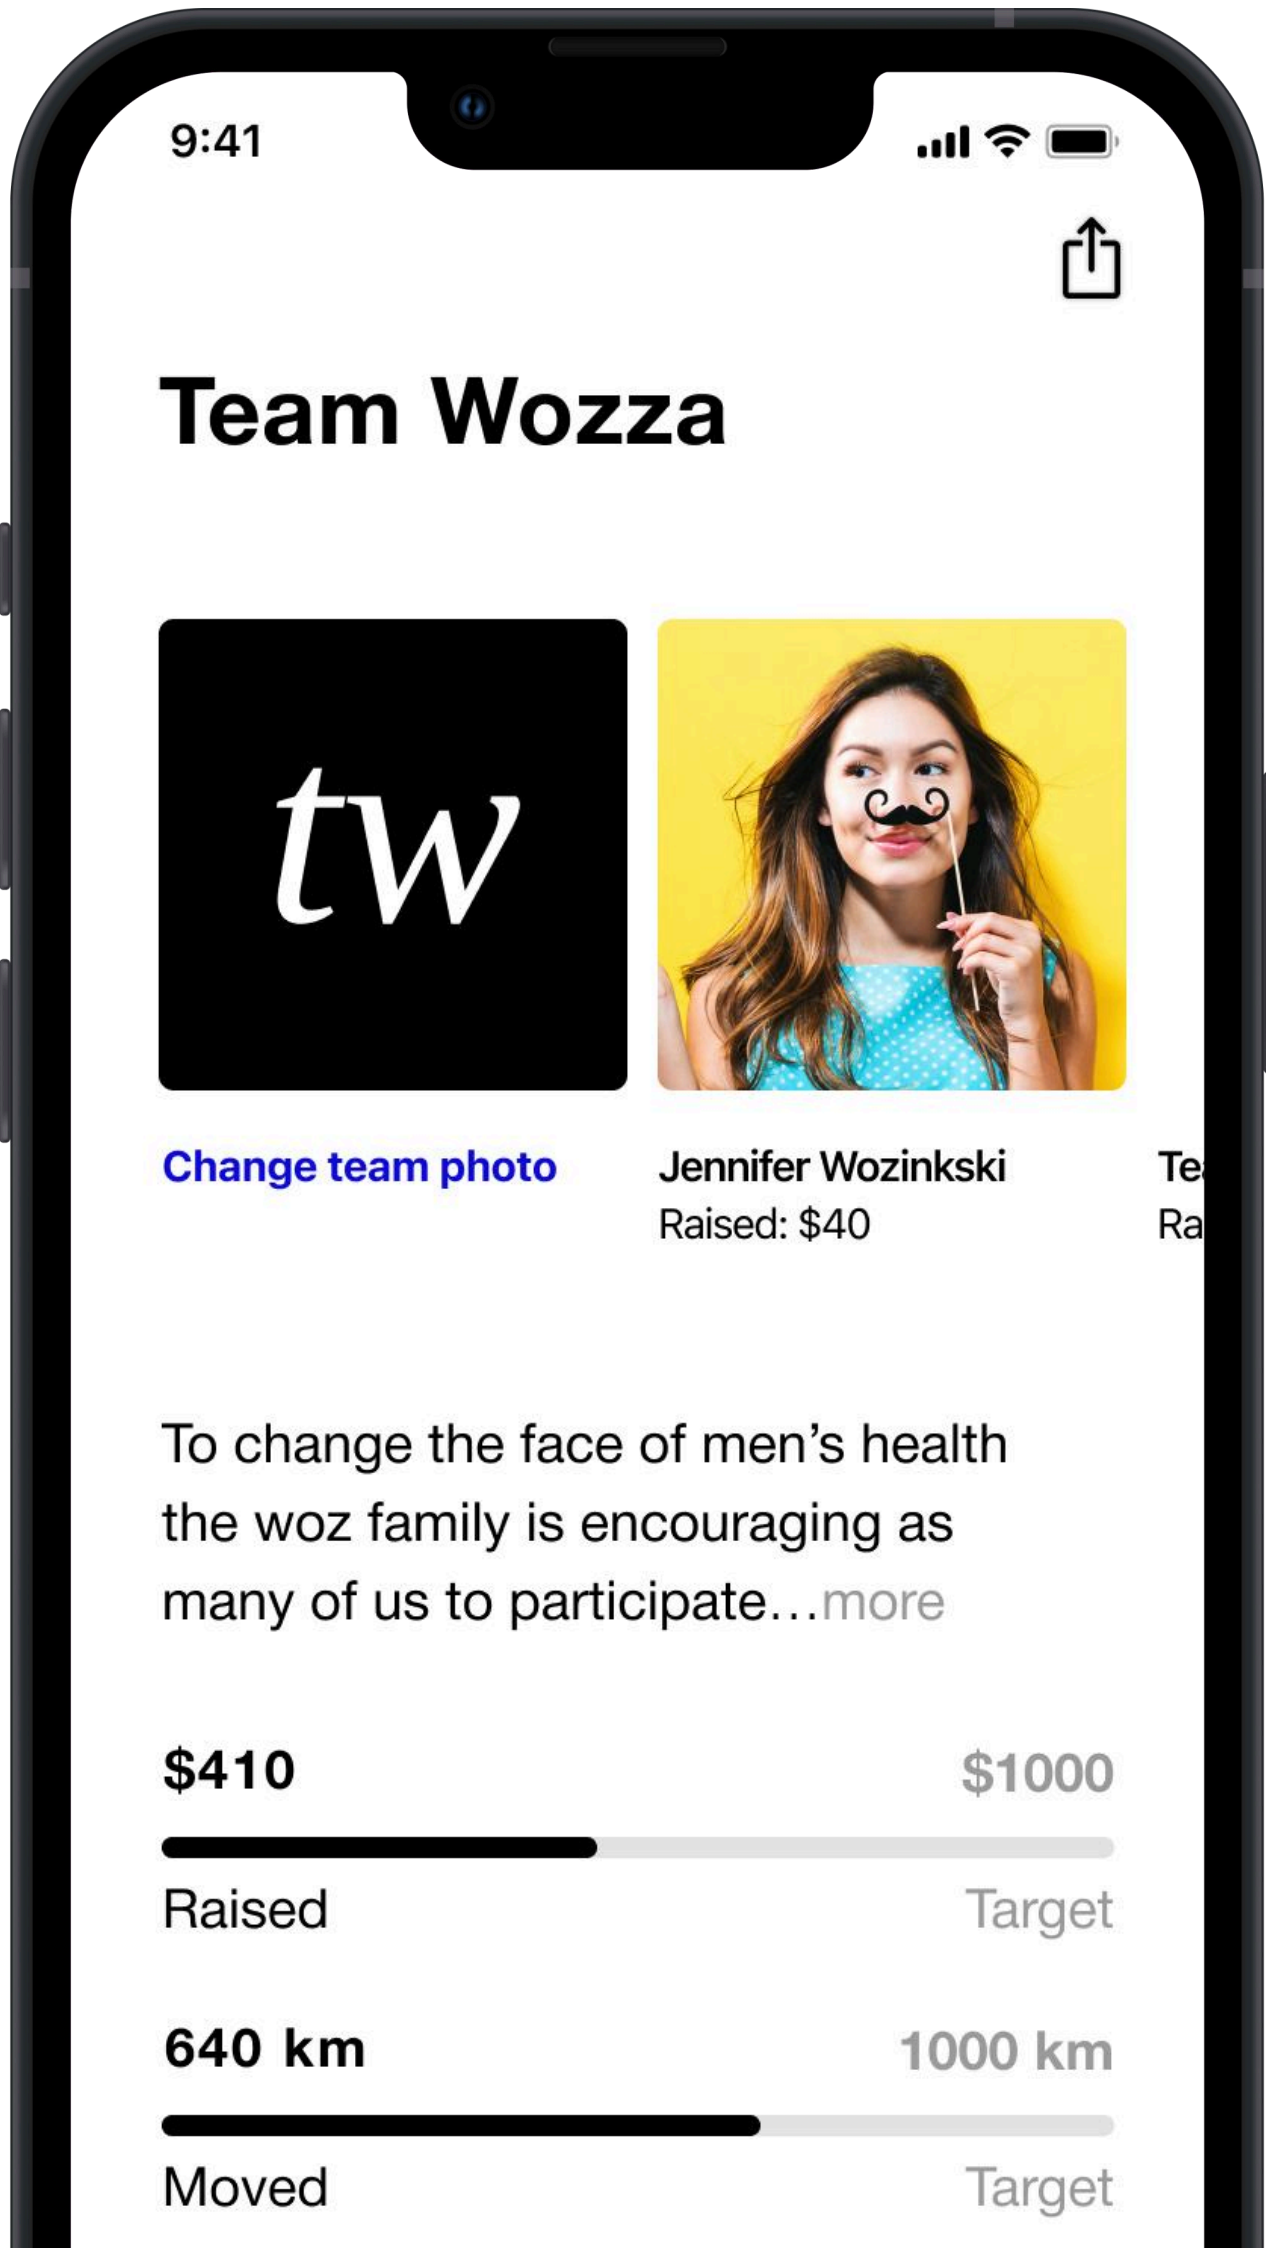

Home page

The clean and simple visual design is designed to provide fundraising progress at a glance. We opted for clear, large and readable typography — choosing colors with high contrast to improve legibility.

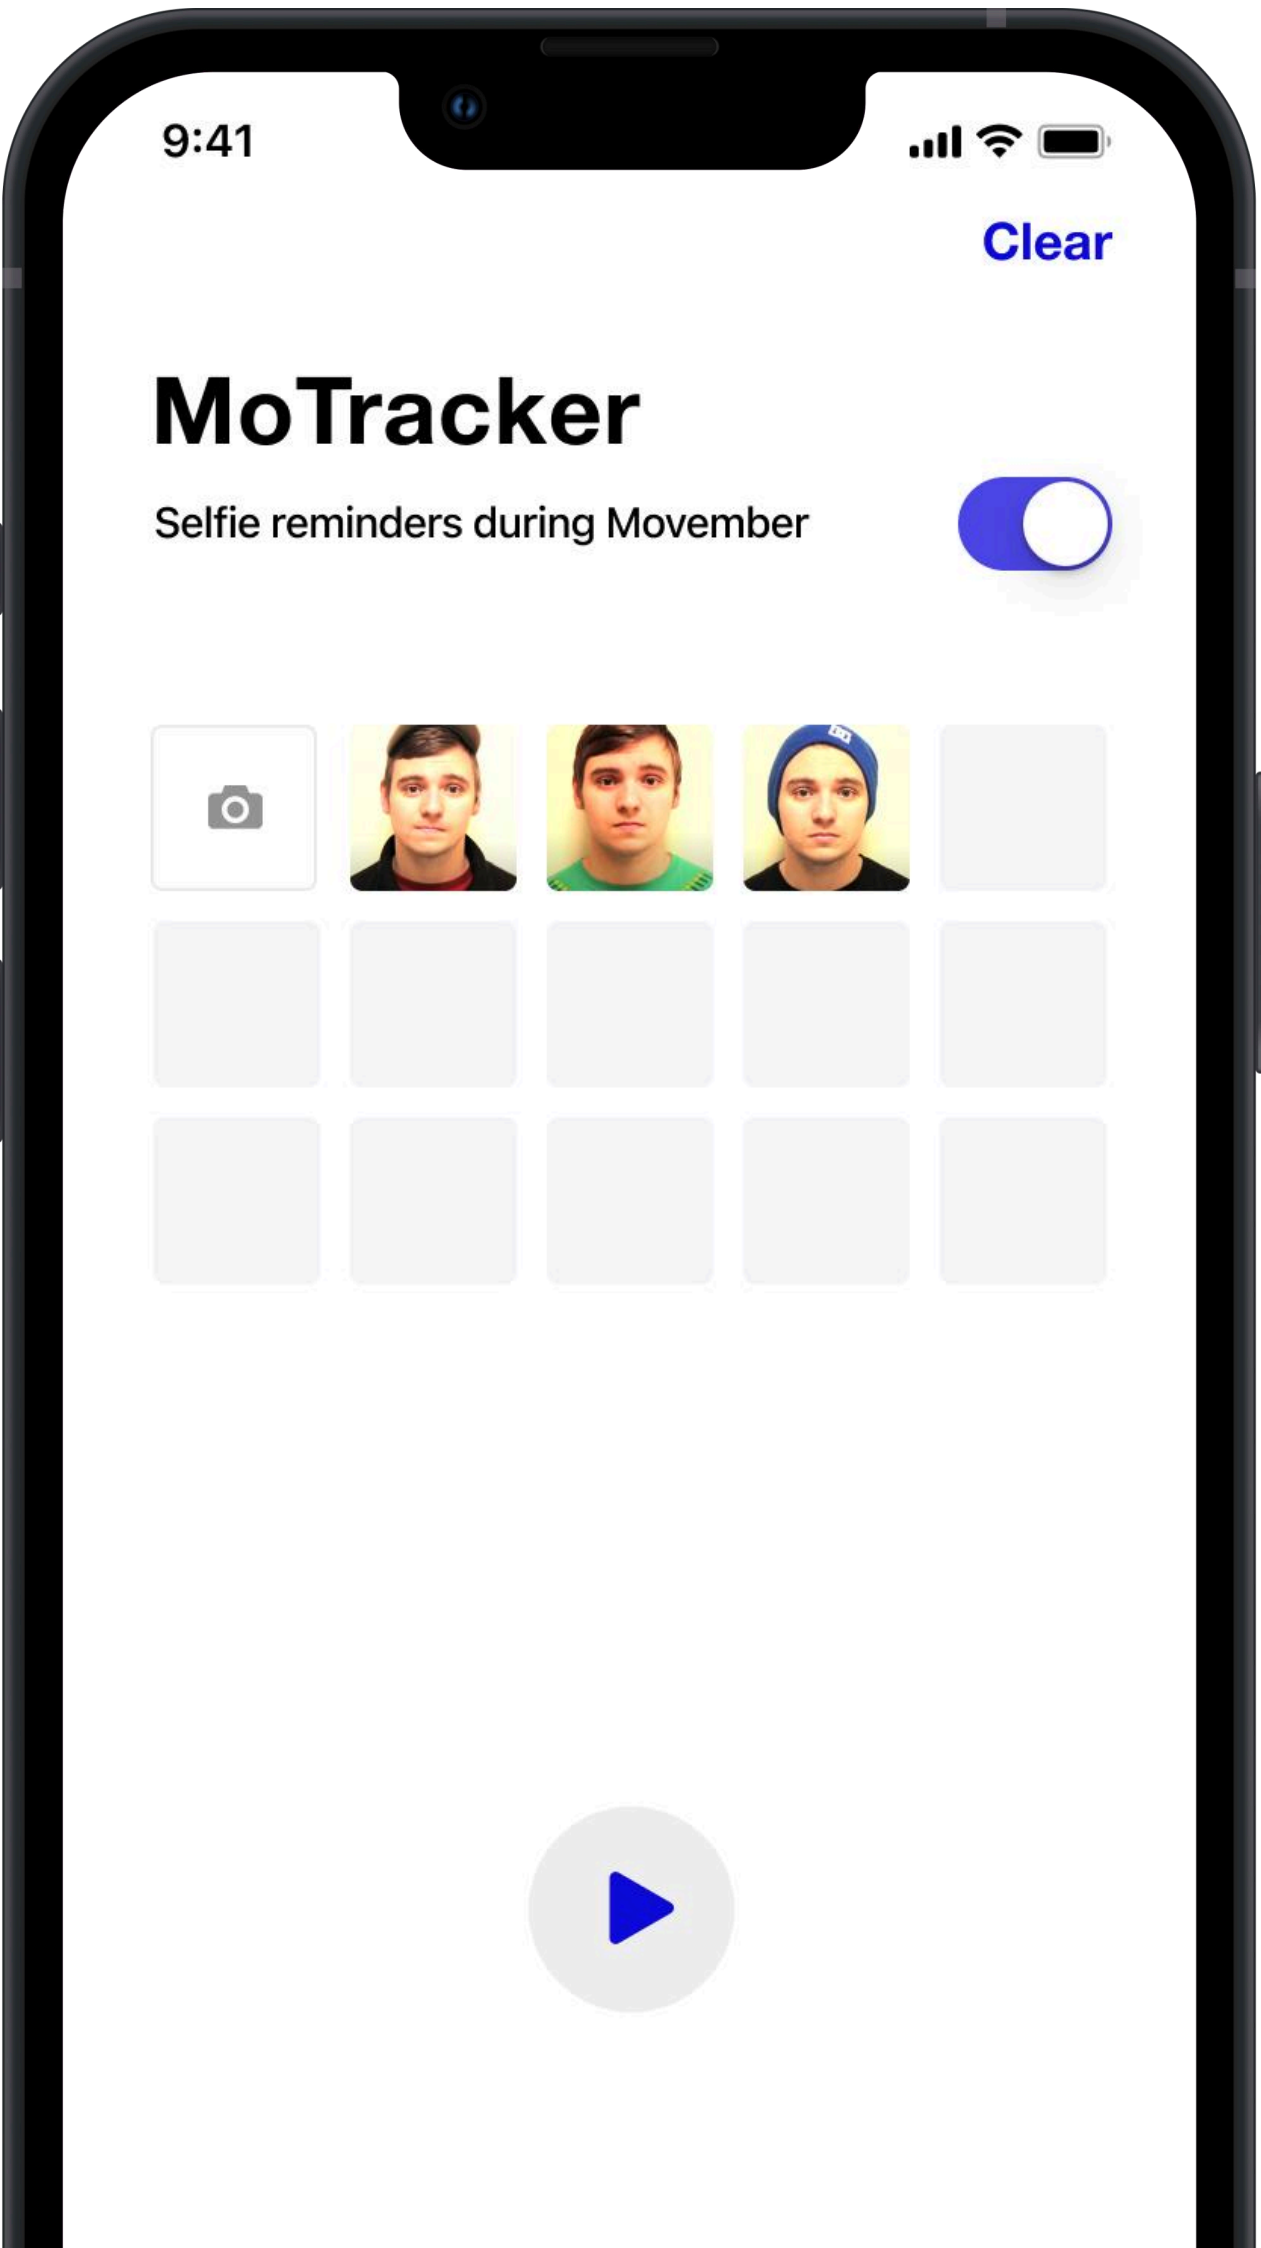

Team page

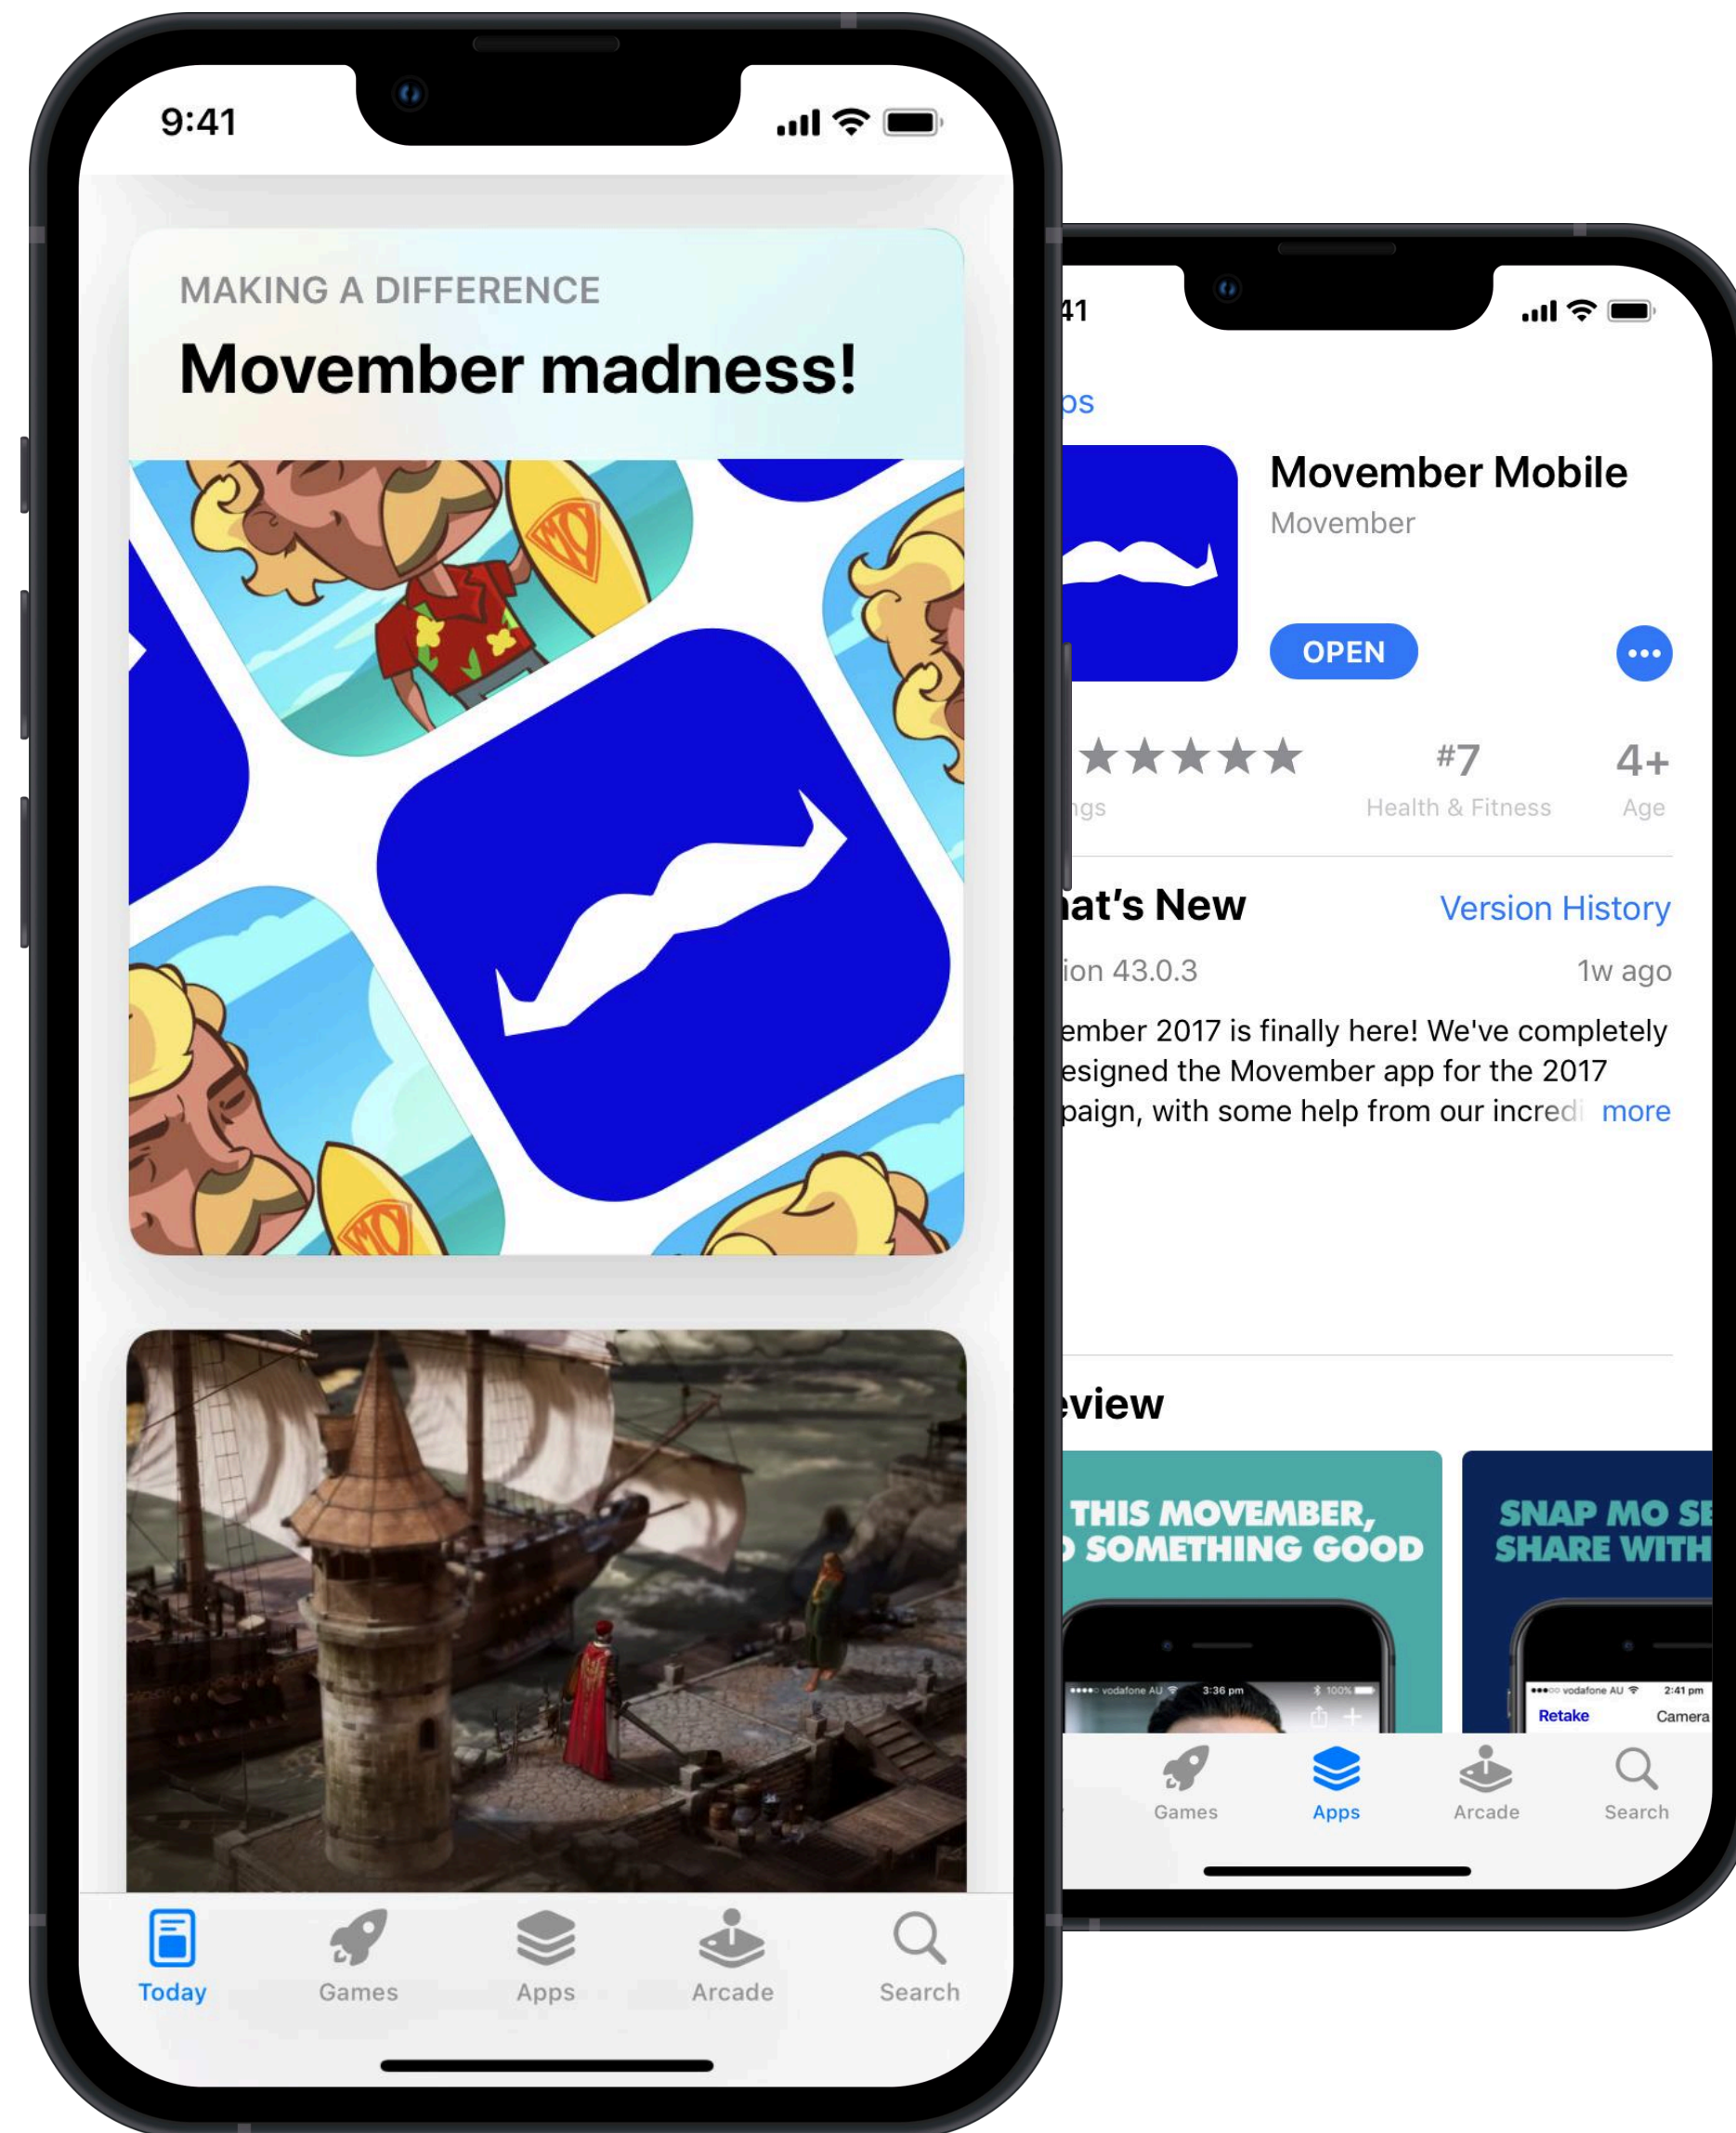

The majority of posted photos were moustache-centric. For this reason, the photos took up most of the visual weight to create both a personalized and branded experience.

Mo Tracker

Leveraging selected iOS patterns from Apple's HIG made the experience familiar, while ensuring scalability for future releases.

Featured in the App Store globally

- 40% increase in iOS users
- 25% increase in session time
- Contributed to raising \$80m AUD

Thank you
