

Age restrictions for Facebook's registration

Due to FTC regulation changes, we had to implement changes on the Facebook registration flow that required people to be at least 13 years old when signing up.

Facebook’s registration flow

Previously, people were able to enter any birthday and proceed. This urgently had to be changed to meet new FTC regulation in 3 weeks.

Challenges

Introduce stricter rules on age requirements

Work with the FTC (and other regulatory bodies) to ensure our registration flows adhered to a minimum age of 13 in order to make a Facebook account.

Mitigate extra friction from new rules

While the new changes were for a good cause, we knew these changes would introduce higher friction than the existing experience which currently let people quickly skip past the date of birth screen.

Goals

What does success look like?

- Minimize negative impact on core growth metrics
- Minimize added friction on the age screen
- Meet FTC deadline to avoid hefty fines

My involvement

As the lead Product Designer, I worked with Product Owners, Data Scientists, Engineers and Researchers to define and pitch design strategy, experiments, and, eventually present these insights to leadership to influence ship decisions.

Understand questions

1

Why don't we have an age limit today?

One of Facebook's biggest growth markets is India, specifically, communities with lower digital literacy rates. Having simple validation/guardrails can introduce significantly higher friction.

2

What's the impact of adding an age limit?

I worked with a data scientist to design and run boundary tests to understand top-line metric impact of basic age validation. This resulted in significant negative impact to WAP@14.

3

What is the right problem?

While the mission critical priority was adhering to FTC regulation, we also wanted to address the poor comprehension for the age screen itself for lower digital literacy markets (India).

4

What does winning look like?

Preventing negative top-line growth metric impact while also reducing screen drop-off rate.

Key insights

People in some rural areas of India couldn't recall their birthdays, and often didn't have official birth certificates.

The registration was a grueling process for our emerging market demographic and could sometimes take up to 45 minutes to complete.

Design principles

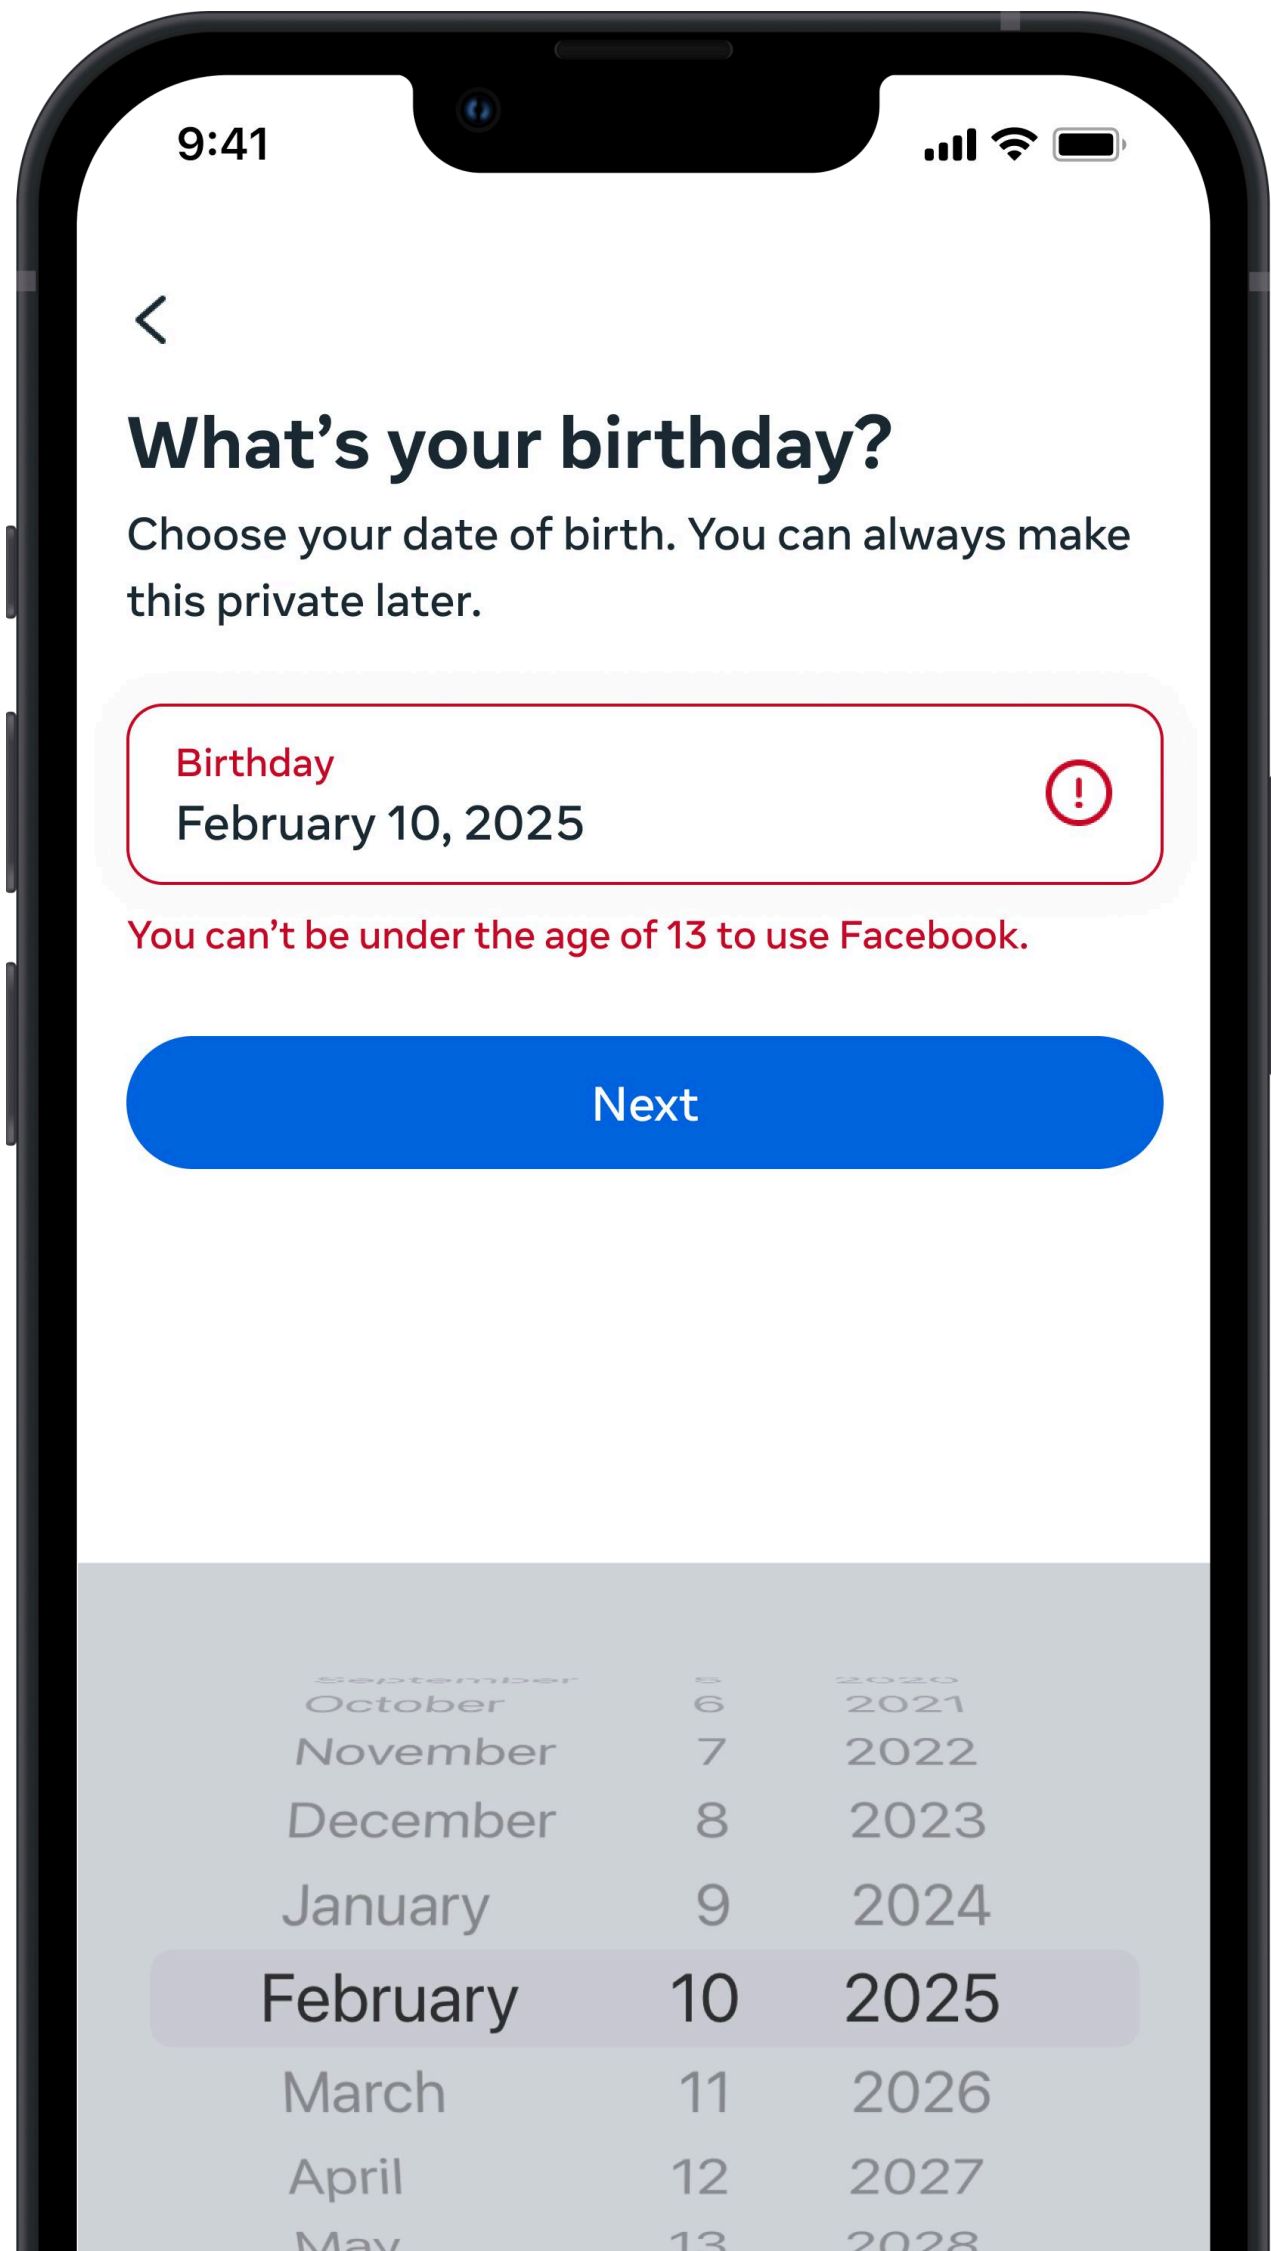

Simple. Make the design simple enough to prevent further alienating developing countries.

Transparent. Improve comprehension of what the age screen is asking.

Actionable. Provide actionable paths through this page instead of roadblocks.

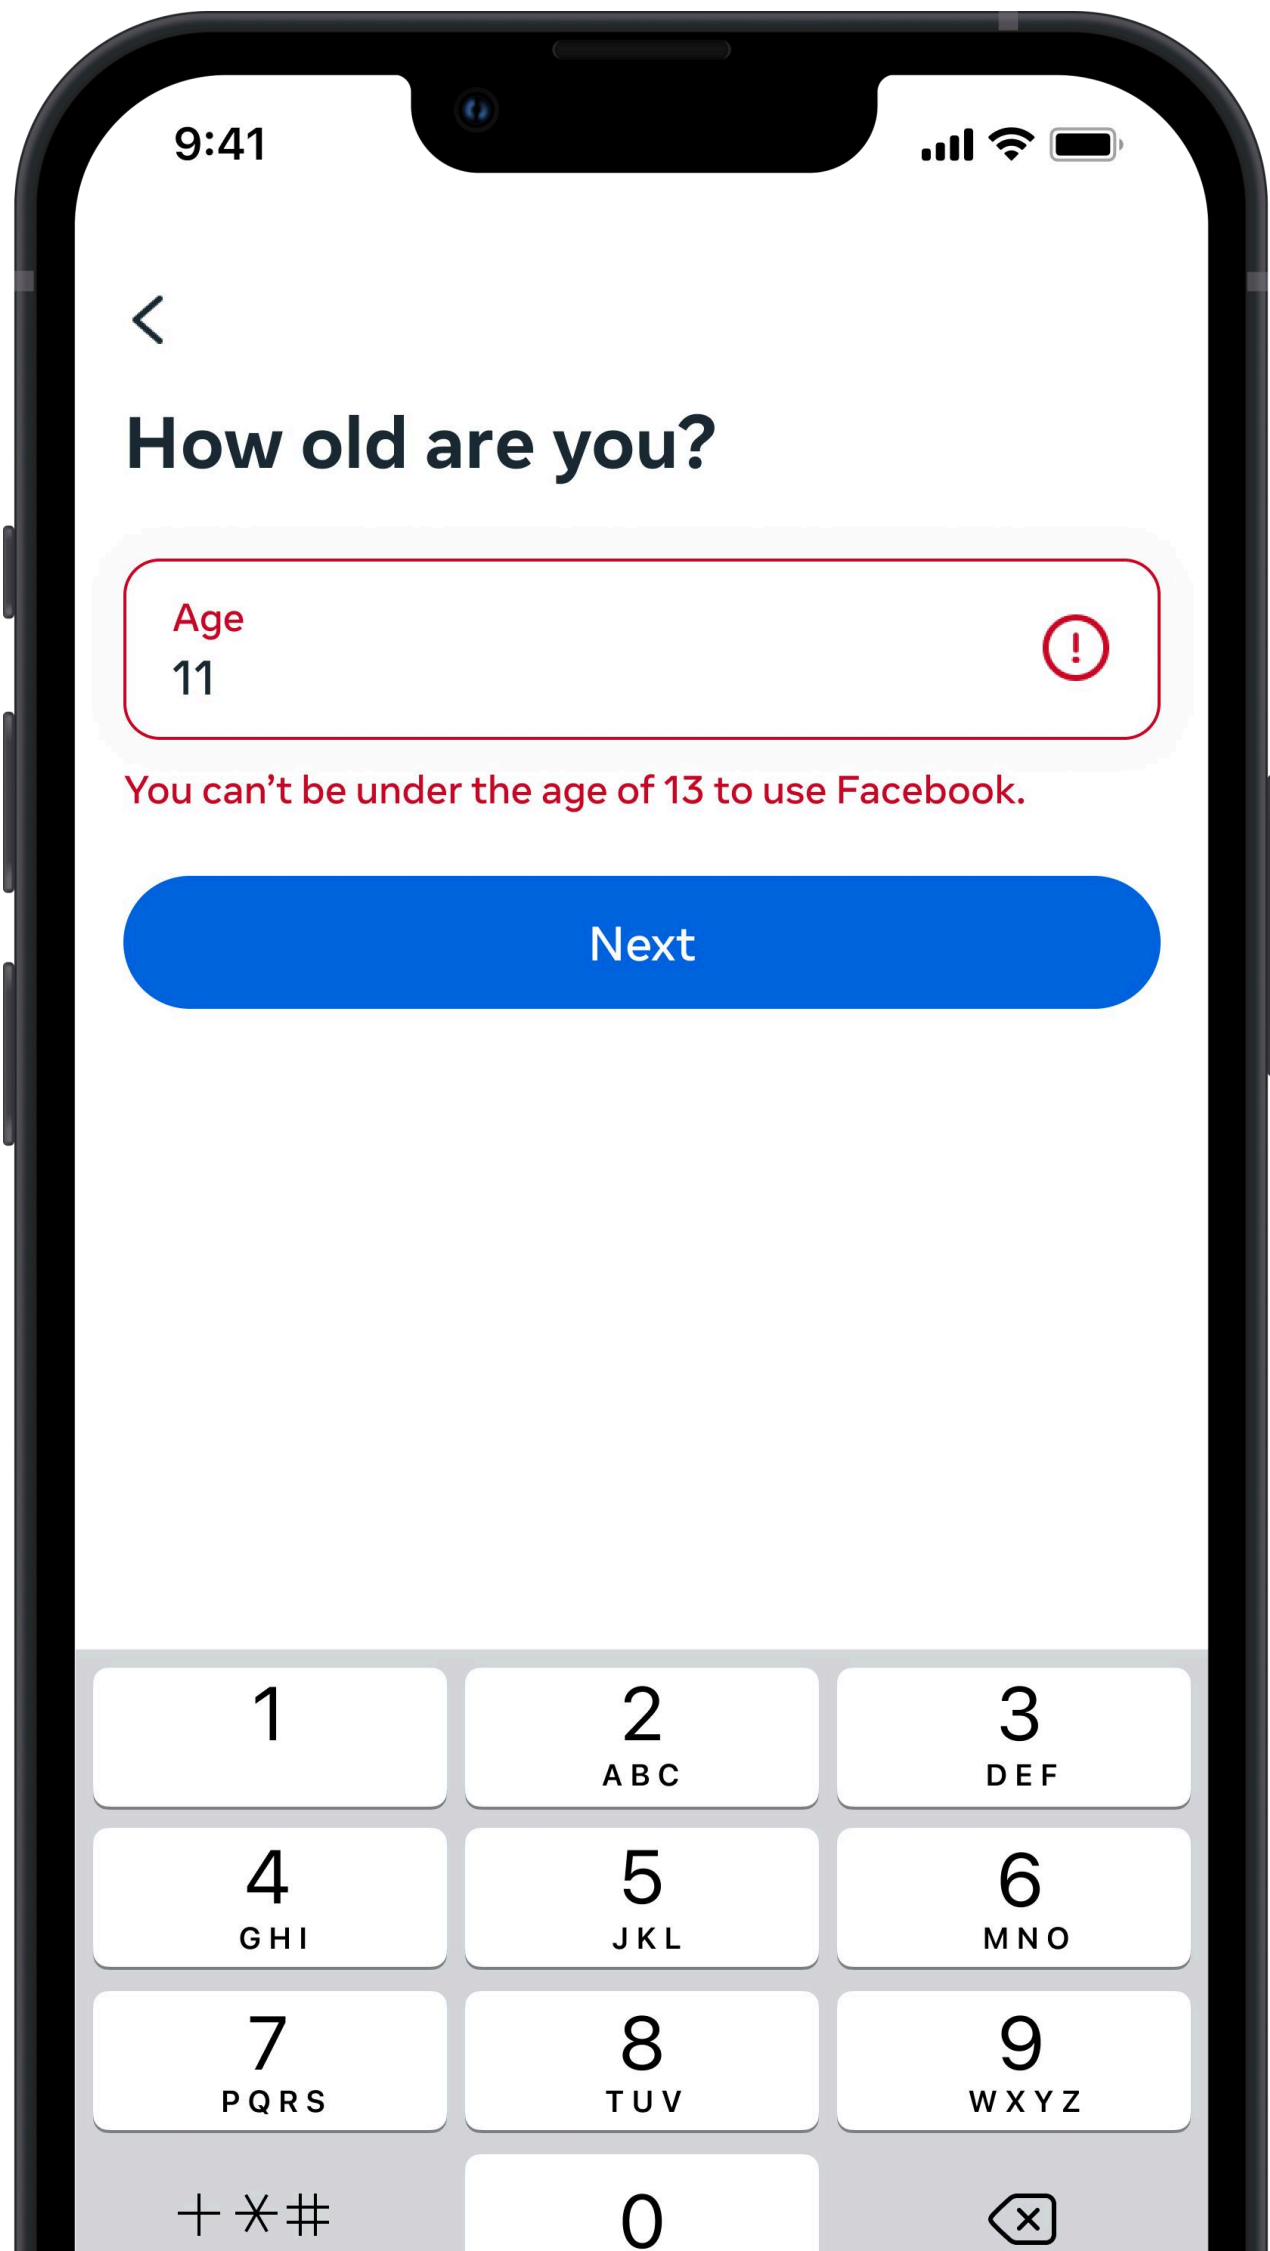

Option 1 - date picker

Here, we explored basic inline validation to explain why they can't proceed to the next page due to the age restriction.

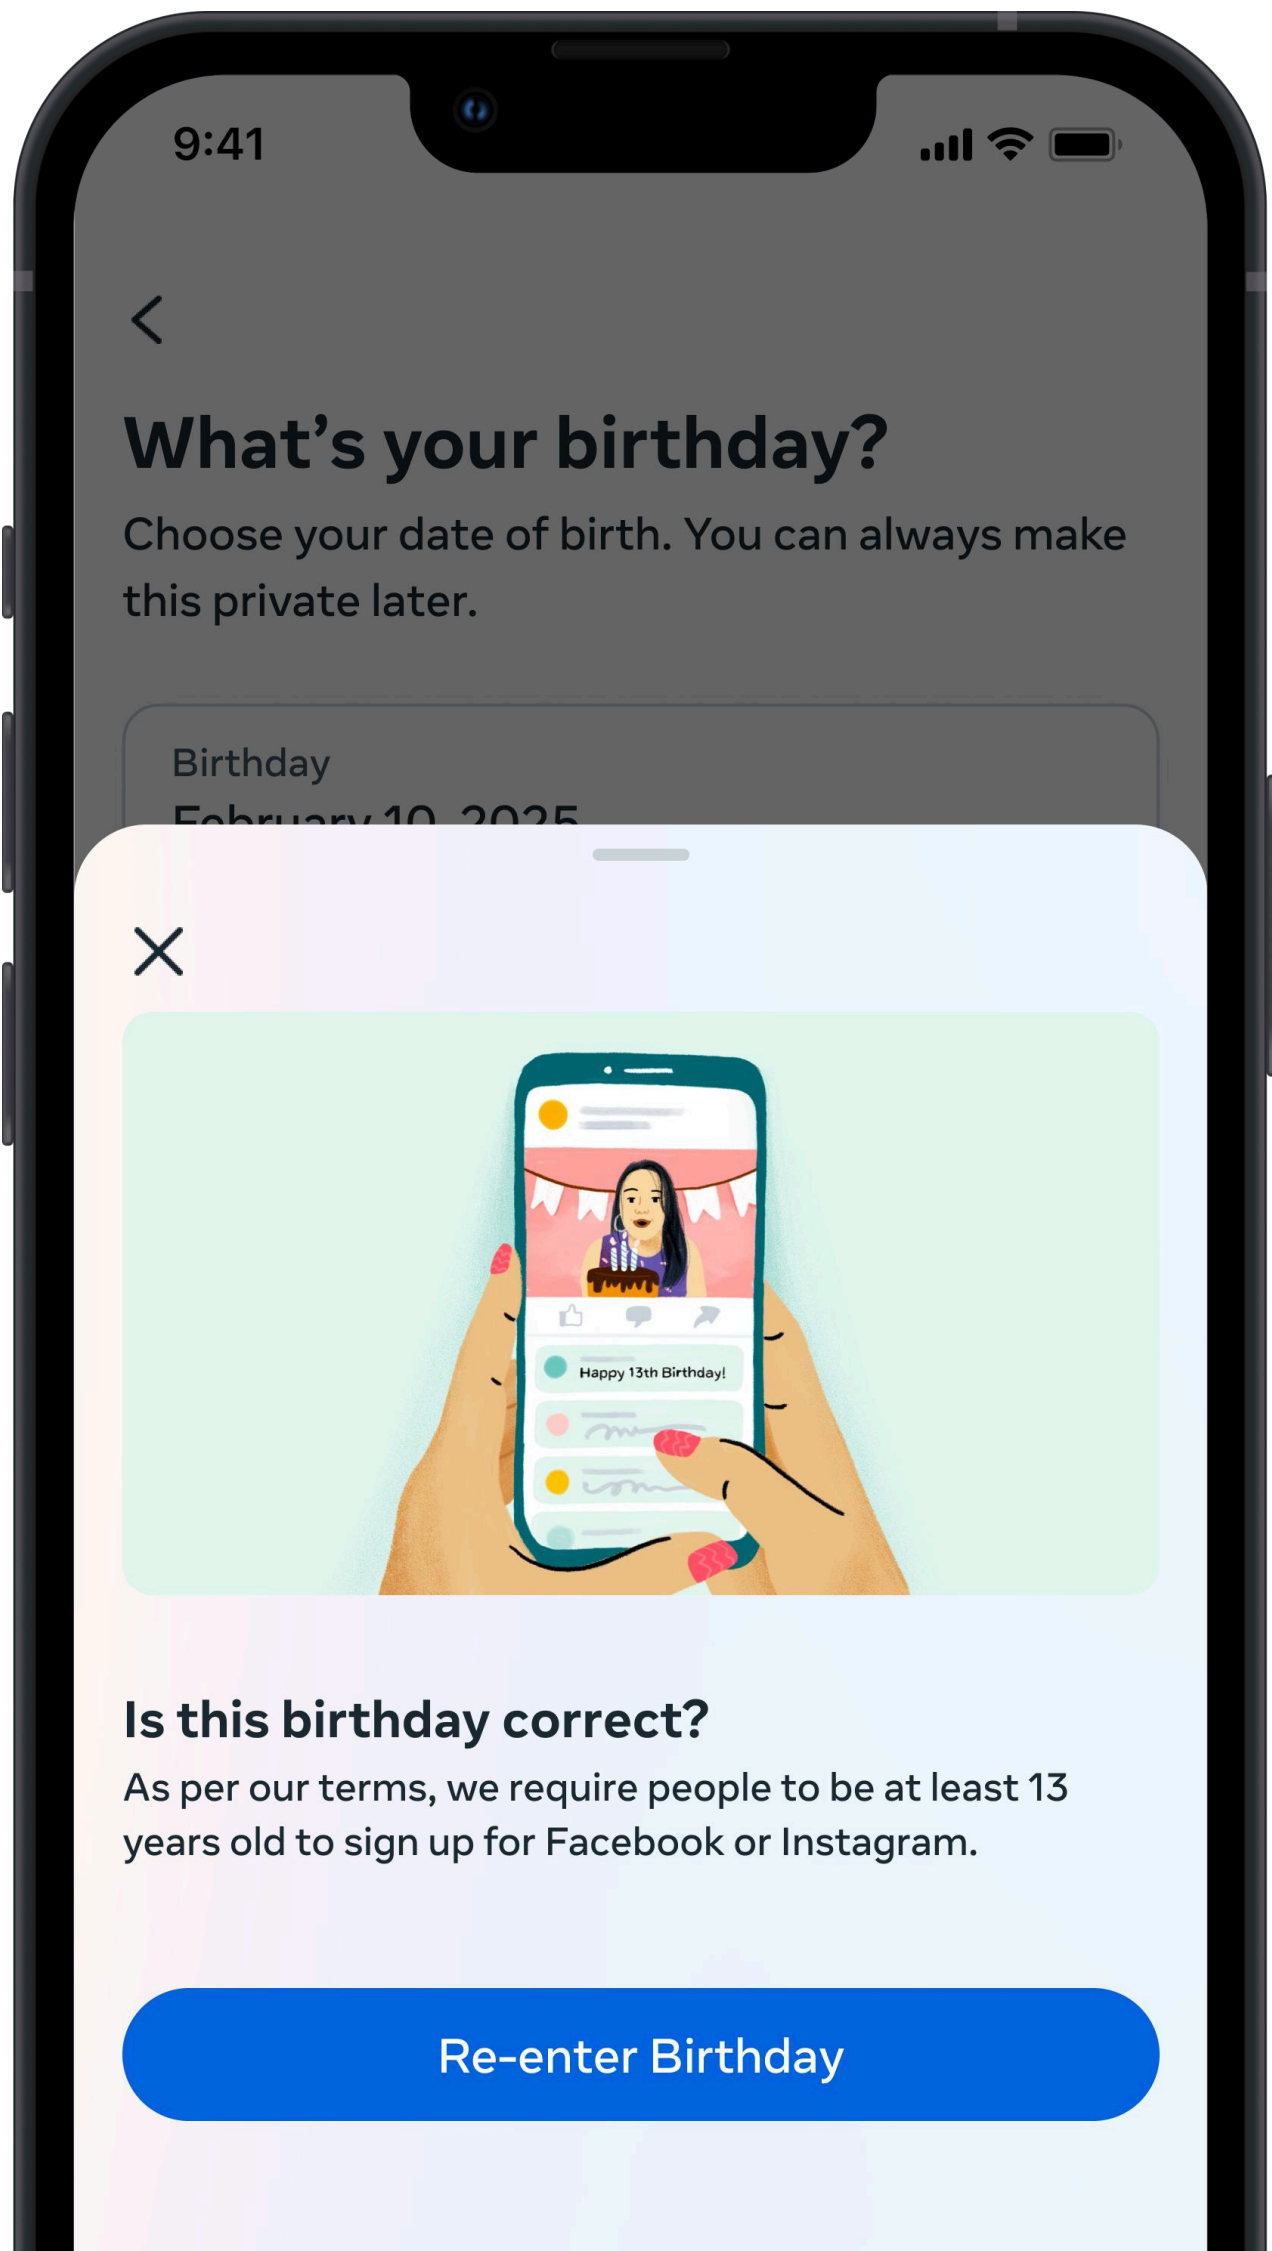

Option 2 - number selector

This version explored entering a numerical value for age instead of a traditional date picker.

Option 3 - helper link

Upon multiple failed attempts, we explored prompting a helper sheet to provide additional context in a more direct way.

Testing the designs in India

User testing & contextual inquiries

Given most of our registration traffic is from India, we traveled there with prototypes in-hand ready to test. Over multiple days we put these prototypes in front of users to gather early feedback, as well as conducting several contextual inquiries from people we had met on the street.

Option 1 - date picker

Here, we explored basic inline validation to explain why they can't proceed to the next page due to the age restriction.

✓ Option 2 - number selector (winner)

This screen had a higher completion rate among our testers, although there were still some concerns around the error messaging being perceived as too visually "harsh" as well as basic comprehension issues.

Use date of birth

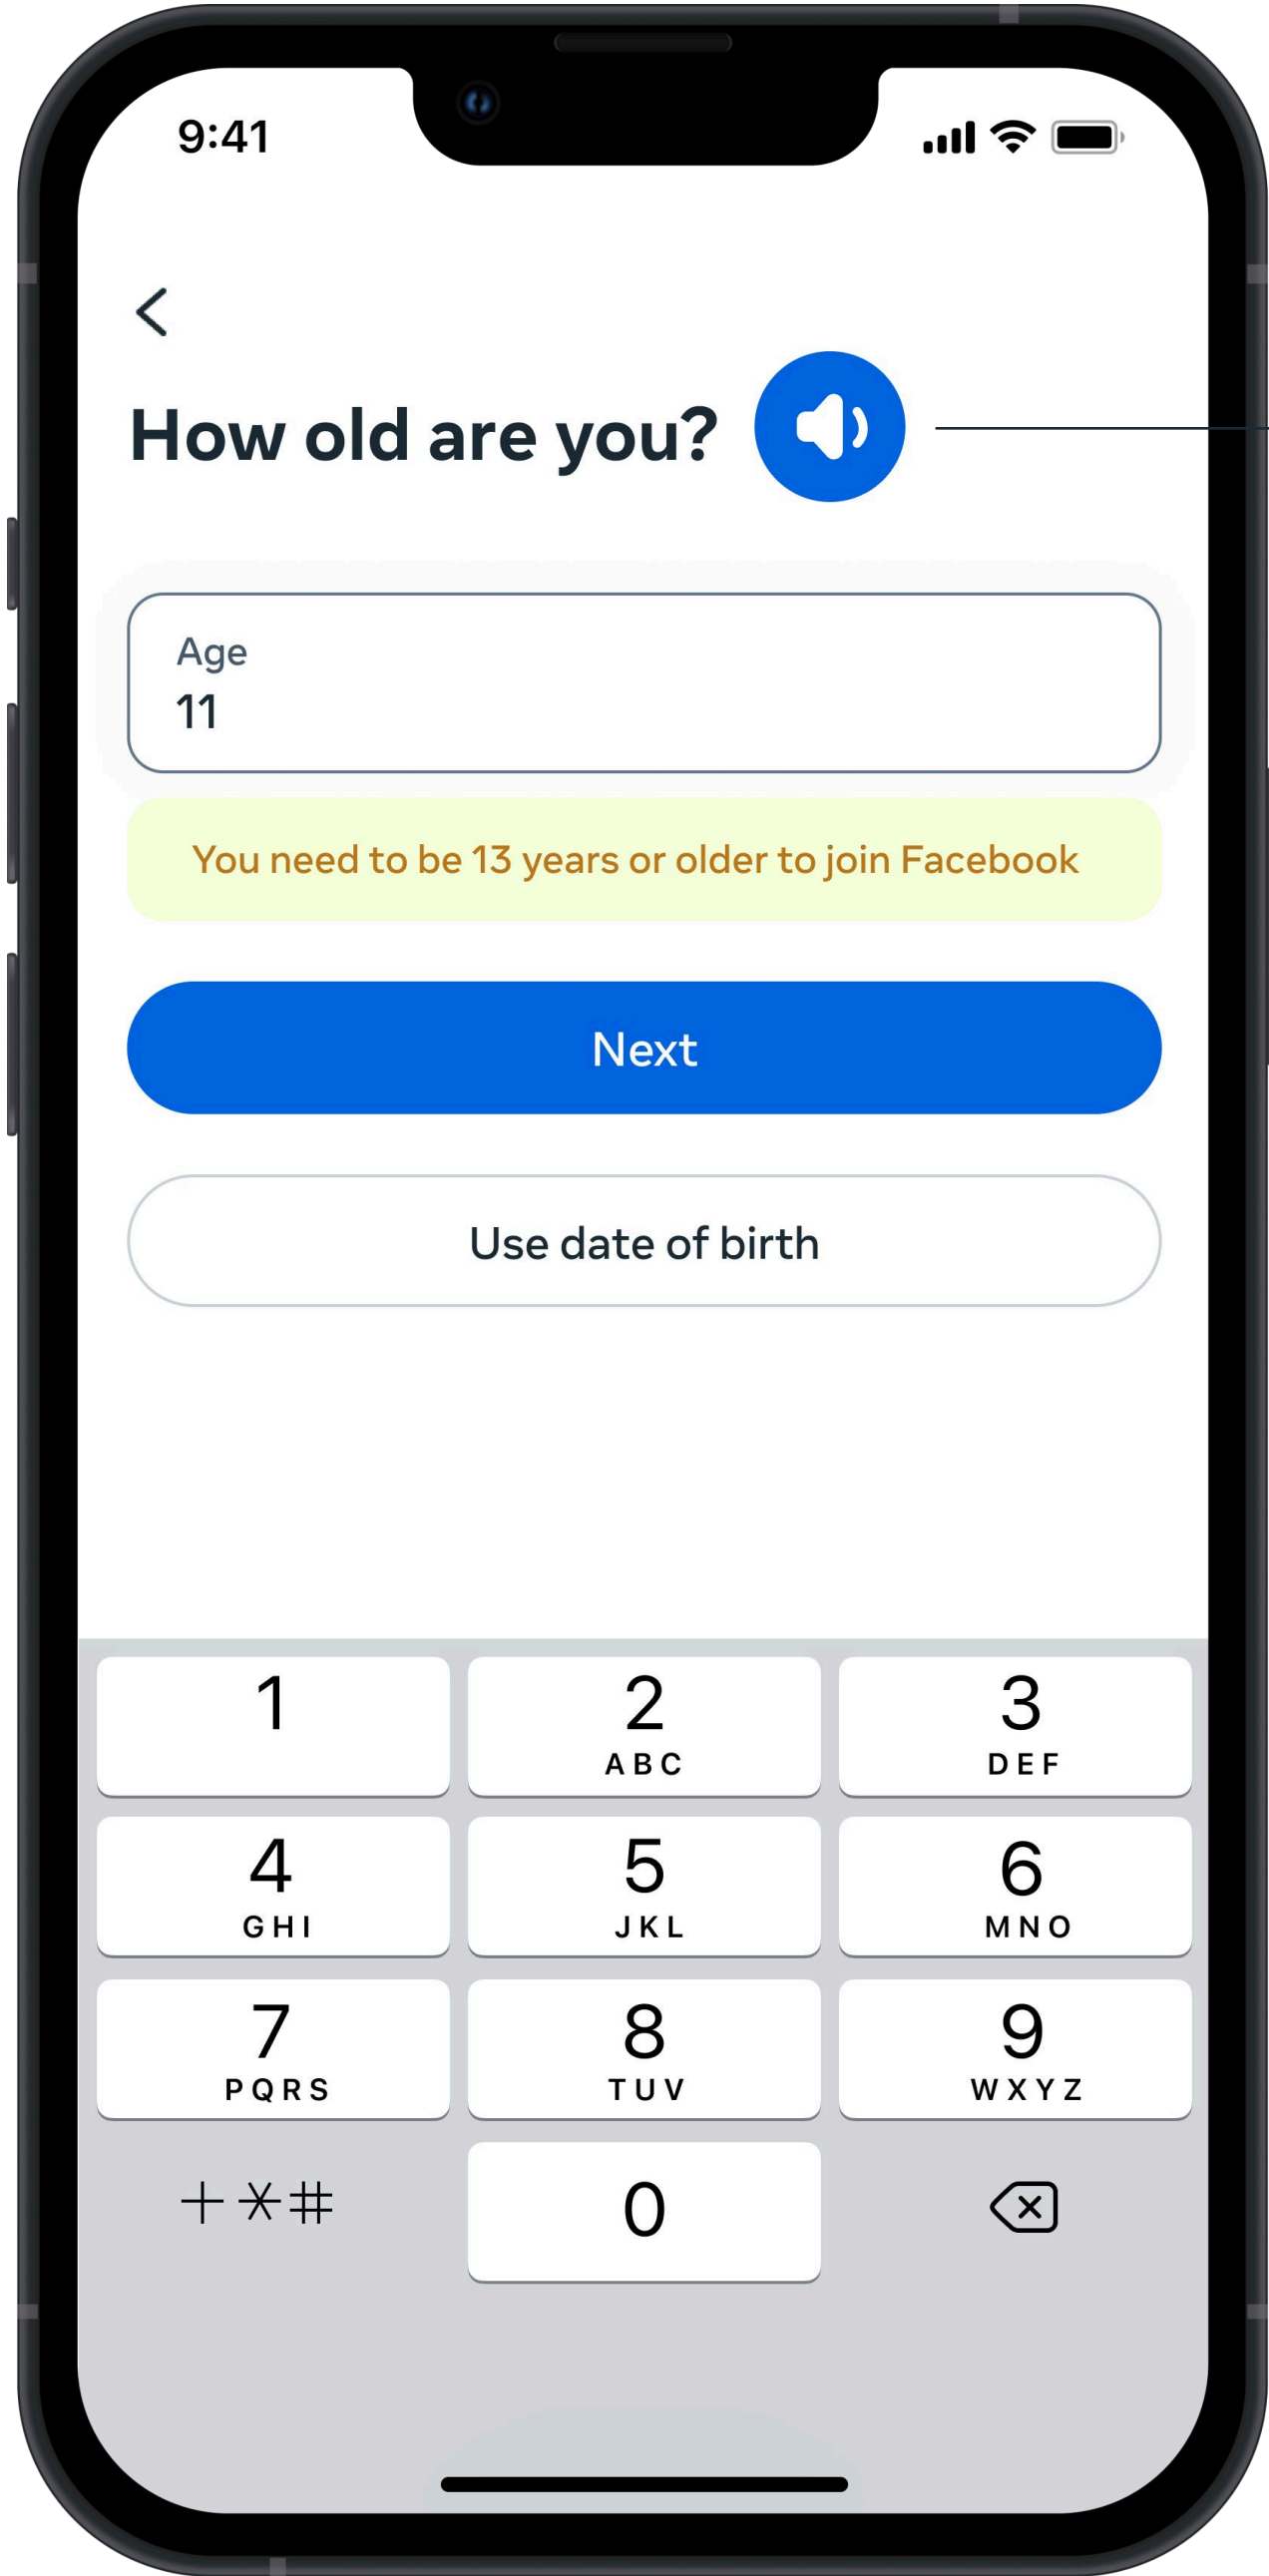

Iterating on an additional concept to improve comprehension

On top of general reading literacy being low in our demographic, there was also 40+ distinct dialects of Hindi which collectively was a driver of comprehension issues. What if we had clearer audio cues that contextually played the right dialect?

NEXT ITERATION

Refining the concept

While we were happy with the simpler direction of the updated designs, we ran into several issues that the privacy and growth leadership team had pointed out. People coming back to Facebook to look at birthday posts was one of the biggest re-engagement drivers for the app, meaning specificity around birth date was paramount. The lack of a specific birth date also left us in a legally grey area.

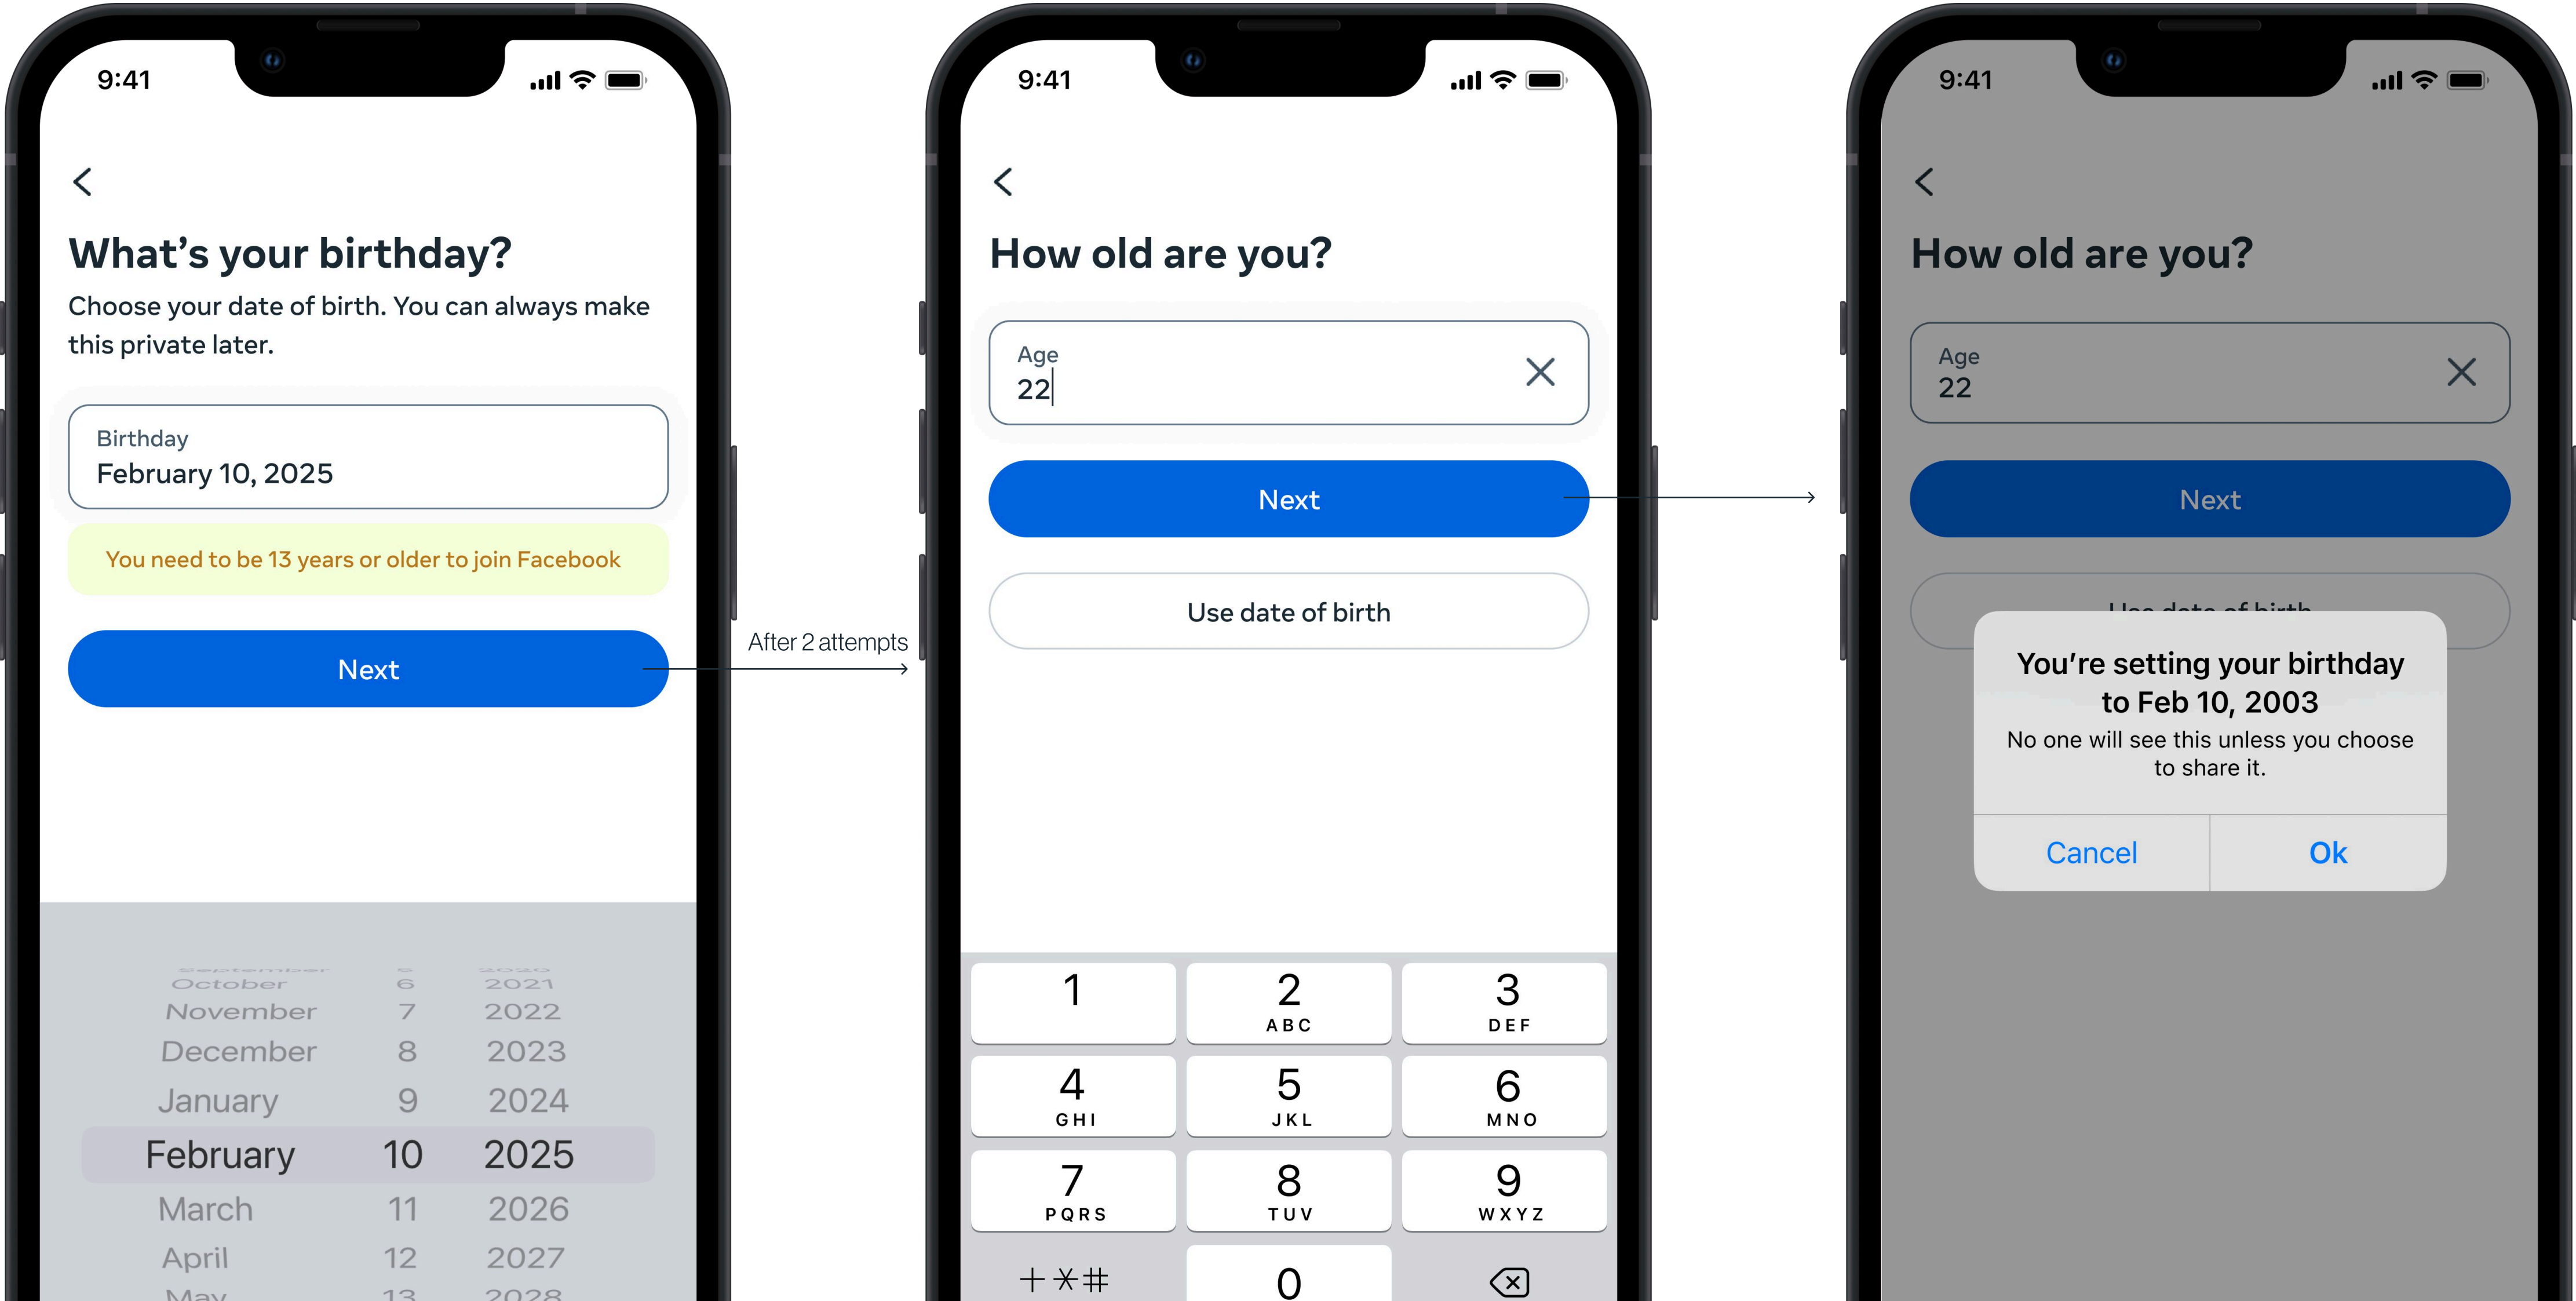

Didn't ship

Audio cues (India only)

To address the literacy gaps in rural parts of India, we conceptualized audio cues to help better explain what's being asked. Due to the complexity of this change, it was deemed out of scope.

Testing & shipping the hybrid age fallback version

Our final version aimed to balance accurate birthday data with ease of use. If people struggled to enter their specific birthday, they could fall back on an easier route via our age input.

Shipped

Product impact

- Prevented negative growth impact to top-line metrics
- Met FTC regulation constraints under tight deadline
- Produced higher accuracy of people's ages (India only)
- Design was scaled and eventually shipped to Instagram
- Audio cues were spun up as a separate project

Detailed metrics confidential due to NDA.

Thank you
